 (31.10.78 as 680062 (29MI))

Proportionator for floury pasty mass, during the baking of bread,
 has chamber (2) containing moving attachments (3) in the form of
 a cylinder with pusher rods (4) and a partition (5). Uniform
 loading on the mass is created together with the accuracy of the
 proportionation, and the quality of the mass is improved, as a
 result of a once-through treatment with reduced friction on the
 side walls of the chamber, by fixing the partition (5) firmly to the
 inner walls of the chamber. Each pusher rod is formed from a
 series of projections and the partition has slits for these to pass
 through. Flanges are fastened to the end surfaces of the delivery
 attachments (3), the flange radius equalling the distance from the
 centre axis to the edges of the pushers. Bul. 1/7.1.81. (3pp

Roe is obtained from fish by passing the fish as a flowing stream to a slit dimensioned such that fish with roe do not pass through but fish without roe do. The fish are forced through the slit. Fish and intestines are separated from roe and water by sieving. The roe is finally separated from the water. Pref. the forcing through the slit is effected using a cylinder rotating towards the slit. The cylinder is covered with a flexible material which exerts a frictional force on the fish.

The device is particularly designed for squeezing the roe from small fish e.g. capelin and herring, the roe being more valuable than the fish itself which may subsequently be used for meal manufacture and animal fodder. (13pp)

Hand tool is for opening the shells of molluscs, esp. oysters. The tool comprises two opposed jaws between which the mollusc is placed. The jaws can be displaced towards each other by manually operated lever gearing offering a mechanical advantage. One jaw has a chisel-edged nose which penetrates between the edges of the mollusc shells and then urges them apart as the jaws approach each other.

The chisel edged nose pref. comprises two flat faces forming a dihedral with an included angle between 10 and 40 deg. The nose is pref. made up of two triangular blades, one face of each blade forming a face of the chisel edged nose. The jaws are pref. mounted on opposed extremities of a pair of levers crossing on a common pivot, scissors fashion. The jaw opposed to the chisel-edged nose pref. offers a serrated, concaved surface to grip the mollusc in opposition to the nose.

Used in opening oysters and other molluscs. The steel is opened easily and without fatigue. There is no danger of a cut hand as when opening with a knife. Opening is clean and the shell is not splintered so there is no danger of the consumer eating fragments of shell. (11pp)

 Meat grain three dimensional template resting on meat - with
 calibrated angled conduits receiving skewer marking grain
 WEINHAUS R S 22.05.79-US-041492
 (01.09.81) A22c-17/10

22.05.79 as 041492 (295DH)

Template comprises a cylindrical block which can rest on the
 surface of a joint of meat. The block has bores which are planar
 and form preset angles to the axis of the block and accept a
 skewer so that it makes a preset angle to the meat surface.
 Typically the block has bores at 30, 45, 60, 90 deg.

In an embodiment the block has further bores arranged to lie
 on cones so that on the exterior surface of the block, the ends of
 the bores lie on concentric circles.

The template allows a user to insert a skewer into a joint of
 meat at a preset angle. The angle chosen and the positioning of
 the template depends on the cut of meat and is made in
 accordance with tables which ensure that the skewer is aligned
 with the meat grain. The user carves the meat perpendicular to
 the skewer so that the slices have a vertical grain. (12pp)

 Brine injection in meat by two independent needle assemblies -
 with separate feed and recovery of excess brine AT 15.12.80)

PROSENBAUER & CO 09.01.79-AT-000156

(01.09.81) A23b-04/02 A231-03/34

31.12.79 as 108598 (295DH)

A motor-driven crank drives a pair of vertically reciprocating

frames. Each frame carries a set of needles which penetrate a piece of meat carried beneath the frames by a conveyor. Each of the needle assemblies is fed from an independent storage tank, pump and pressure regulating valve.

The fluids from the tanks are injected on the downward stroke of the frames and any excess fluid is recovered and returned independently to the respective storage tanks. Preferably the frames are slightly inclined to the vertical by complementary angles so that they form a V. Preferably the frames include stripper plates and shut-off valves.

Angling of the frames prevents the needles of the downstream set entering the apertures in the meat formed by the other set. Each set injects brine of a different concentration. (7pp Dwg.No.1)

A feedstuff for ruminants is based on carbohydrates (I) and a crystallised glycosylurea (having a purity of at least 90% and not containing more than 10 wt.% chemically unbound urea and glucose) as a stimulant for the digestion and assimilation of (I). (I) may be a mixture of 30-70 wt.% (of the feedstuff) starches and 20-50 wt.% (hemi)celluloses. The feedstuff also contains water, binders, premixes, fat and/or flavours.

(II) is produced by heating one equiv. of glucose with one equiv. urea at 60-70 deg.C. in the presence of a strong acid (H2SO4) as a dehydrating agent and diluting with 30-50 wt.% water so that, by concentrating and cooling, (II) of the requisite purity will deposit by crystallisation. (7pp)

C03 (D16) (09.09.81) *DE3007-383 A23k-01

08.12.80 as 107710 (1251) (G) DS1061608 DS-174864 DE1792016 WP7900183 DE2512258 DS2629268 DE1492787 FR-921734 DS2643093 E(AT BE CH DE FR GB LI NL)

Prod. of a concentrate (A) comprises first evaporating yeast liq. opt. after adding a soln. or suspension of by-prods. (B) from the dairy, starch or food industries or from industrial fermentation processes, to give a pre-concentrate (C) of 16-50% dry matter content. This is mixed with suitable raw materials to increase dry matter content to 35-60%, then the blend dried to over 80% dry matter.

The final prod. contains, per 100 pts. dry matter, (a) 20-60 pts. yeast liq. solids; (b) 30-60% milk by-prods. solids; (c) 5-25 pts. starch prod. solids; (d) 0-15 pts. cellulose and-or prods. rich in crude fibre; (e) 0-25 pts. fermentation process solids, and (f) 0-20 pts. solids from alcoholic fermentation, pulps or hydrolysates. (A) themselves are also claimed.

(A) are useful for human and partic. animal nutrition. It can be made with a sstandardised compsn.; has satisfactory stability; does not have any unpleasant taste; and is made simply and economically (esp. reduced energy costs for evaporation) from waste materials. (A) are rich in proteins, B vitamins, minerals, trace nutrients, enzymes and 'unidentified growth factors'. (32pp)

Free-flowing solids prodn. from salinomycin culture broth - by fermenting to minimum extractable fat content and spray drying with the addn. of anticaking agents

HOECHST AG 15.02.80-DE-005642

B04 C03 (D16) (09.09.81) *DE3005-642 A23k-01/17 + C12p-01

05.02.81 as 100801 (280AT) (G) No-Citns. E(AT BE CH DE FR GB IT LI NL SE)

In isolation of solids from salinomycin culture broths, (a) the lowest possible level of extractable fats and fat-like substances is attained in the fermentation and (b) a physiologically tolerable anti-caking agent is added during the spray-drying. Salinomycin culture broth solids contg. physiologically tolerable anti-caking agents are claimed.

Salinomycin is used as a growth and feed utilization improving feed additive. It is also used in veterinary medicine as a coccidiostatic agent. Unpurified solids from salinomycin fermentation are suitable for use as feed additives. Observation of the conditions specified above gives a non-caking product; observation of either condition alone does not impart non-caking properties.

Pref. the salinomycin fermentation is continued until the extractable fat content has fallen to below 2%. The anticaking agent, which is pref. added before spray drying, is pref. finely powdered calcium carbonate or silicic acid. (11pp)

Grain drying chamber with horizontal air distribution channels - located and fitted without supplementary fasteners or welding

COMIA FAO SA 07.02.80-FR-002664

P12 (14.08.81) A01f-25/14 A23b-09

07.02.80 as 002664 (448HM)

In grain drying chamber grain is filled into the space between a pair of parallel, vertical walls. A series of air distribution channels extends horizontally between the walls. Each channel is in the form of an inverted gutter, i.e. with channeled side facing downwards. One end of each channel communicates with an air supply hole in the wall at that end.

The air supply end of the channel extends through the wall and has an enlargement on the outside which is of similar cross-section, but will not pass through the hole. The other end of the channel has a longitudinally projecting integral to ngue which passes through a slot in the second wall and is folded over an the outside of that wall, wall. The chamber is pref. pressed in sheet side walls topped with a dihedral ridge-roof. The cross-section of the channel pref. tapers progressively, reducing from the air supply end.

Used for drying bulk grain. This type of air distributor not only series as a stiffener between the walls, but is fitted without any supplementary fastening such as bolts, rivets or welding. Speed of assembly and dismantling for removal are greatly increased. (9pp)

Heat treatment vessel for milk prods. esp. thick cream - circulates heat transfer fluid through passages in rotary agitator impellers

GOAVECSA 08.02.80-FR-002852
P13 (14.08.81) A01j-13

08.02.80 as 002852 (448KB)

The vessel is pref. vertical cylindrical and contains a vertical, coaxial, rotary shaft fitted with an agitator in the form of impeller blades. The vertical shaft and the blades now have internal passages through which heat transfer fluids are circulated under pressure in order to warm or cool the contents of the vessel above the surface level of the contents, the rotary shaft pref. has a rotary coupling with branch inlet and outlet for heat transfer fluid for circulation.

The coupling pref. has a rotary inner member, integral with the shaft which contains inflow and return passages for heat transfer. (11pp)

FRIN/ ★ D13 68345 D/38 ★FR 2475-360
Prepn. of butter flavoured with herbs or condiments - added to the churned milk cream at end of mixing

FRINOTM 08.02.80-FR-002754
(14.08.81) A23c-15/12

08.02.80 as 002754 (597NS)

The butter, ready for using in cooking after removal from the refrigerator, is prepd. by adding to the churned milk cream, at the end of the known mixing operation, a predetermined amt. of herbs and/or condiments. The homogenised mass is then moulded, wrapped and frozen. Pref. herbs are parsley, chives, chervil, sorrel, basil, spinach, provence herbs, thyme, laurel, and rosemary.

It avoids work and time required to prepare the flavoured butter from butter when required in cooking. The butter is stable to cold storage. (5pp)

FROM- ★ D13 68346 D/38 ★FR 2475-361
Prepn. of dairy prods., pref. cheese, using ultrafiltered retentate - treated with additive or formed into layered and/or veined prods.

FROMAGERIES BEL 07.02.80-FR-002708
(14.08.81) A23c-19/06

07.02.80 as 800270 (597AS)

The process comprises ultrafiltration of milk, opt. after standardising in fat and opt. maturation with lactic ferments, followed by treatment of the retentate selected from incorporating an additive; preparing multilayer dairy prods.; preparing veined dairy prods.; and preparing dairy prods. having one or more layers with a veined appearance.

The process enables easier prepn. of the above prods. as the curds produced in the normal cheese making process only retain additives with difficulty produced in the normal cheese making process only retain additives with difficulty. (11pp)

LOWE- ★ D13 68414 D/38 ★GB 1598-069
Semi-moist animal food made from raw, blanched or cooked meat - mixed with shortening, soya, sugar, farina and CMC in a bowl chopper with no cooking after mixing

LOWE FC & SON LTD 21.12.76-GB-053301
A97 C03 (16.09.81) A23k-01/10

21.12.77 as ----- (513RH)

Semi-moist animal food for pets is made by mixing uncooked, blanched or cooked meat and/or offal, starch-contg. materials and sugars and chopping the mixt. in a bowl chopper until a homogeneous plastic prod. is obtd. without subsequent cooking of the mixt.

In a pref. process, tripe and liver are heated at 212 deg.F for 0.5 hours and lights are blanched, then the meats are chopped to a fine grist in a bowl chopper. Shortening, soya, sugar and farina and added, together with a premix of potassium sorbate and propylene glycol plus CMC and salt and a small amt. of colouring and water. Chopping is continued to give the correct texture, then the mixt. is minced and packaged.

About 33% of the meat and/or offal and all the non-meat ingredients are in the raw state with the proteins in the natural condition; the high water-holding capacity of these contributes significantly to the character of the compsn. The prod. contains less water soluble material w.r.t. water than known prods. No flavouring agents are required, the flavour being determined by the combined organoleptic properties of the ingredients. (2pp)

BOEH D13 19762 A/11 = GB 1598-253
Stable buffered aq. food acid solns. - prepd. by partially neutralising a mixt. of lactic acid and citric acid etc. with potassium ions

BOEHRINGER INGELHEIM 07.01.77-DE-700568

Aq. non-crystallising solns. of organic food acids, other than tartaric acid, have dry solids content above 55 wt.%, 8-20% of the number of equivs. of food acids present are in the form of their K salts, the remainder are in the form of the free acid or other salts. Pref. the pH of a 1:10 diluted soln. is 2.7-3.3. Suitably the solns. comprise lactic acid with up to 25% citric acid.

Inexpensive buffered solns. are provided which are easy to pump, can impart agreeable acidulous taste and do not lead to side effects such as saccharose inversion or gelatin degradation. Used esp. in confectionary, drinks and also in leather tanning. (5pp)

KERR- ★ D13 68431 D/38 ★GB 1598-362
Emulsified food prepn., esp. low calorie butter - by emulsifying a fat with an aq. phase of skimmed milk or sweet buttermilk contg. caseinate salt(s)

KERRY CO-OPERATIVE 31.12.76-IE-002866
(16.09.81) A23d-03/02

28.12.77 as 053991 (513RH)

Emulsified food prepn. is made by emulsifying an aq. phase comprising skimmed milk or sweet buttermilk contg. caseinate salt(s), with a fat phase. The fat phase is e.g. a fat or oil derived from full fat milk, esp. butter, butter-oil or cream or a mixt. of these. The fat phase may also contain vegetable oil. The caseinate salt used is pref. derived from skimmed milk, e.g. by acid pptn. of curd followed by treatment of the curd with alkali. The caseinate salt is pref. in spray dried form. Pref. the aq. phase makes up 25-65 wt.% of the whole compsn. Emulsification is pref. carried out at 40-50 deg.C, the pH of the emulsion is adjusted to 6.4-6.8 with a buffering agent, the emulsion is pasteurised at 72 deg.C for ca. 15 seconds, cooled to 14 deg.C and allowed to solidify. The solidified emulsion is pref. cooled to 11 deg.C and mechanically worked to achieve uniform distribution of droplets of the aq. phase.

Prods. may be made in the form of butter-like prods. with a relatively low calorie content and relatively high protein content cf. natural dairy prods. such as butter. (6pp)

Mfg. carrageenan by gelling with aq. salt soln. - where gel obtd. is sepd. from aq. salt soln. using centrifuge, dried and pulverised

MASAYUKI MATSUMOTO 28.12.79-JP-173175

A11 (03.08.81) A231-01/04 C08b-37

28.12.79 as 173175 (57KB)

Process comprises cooling extracted carragheenan liq. obtd. in extn. purificn. process of carragheenan to 20-50 deg.C, jetting it in fine line in an aq. soln. contg. alkali metal salt with concn. 0.5-5wt.% to gel, sepg. the gel from the aq. salt soln. by suitable process such as centrifugal hydroextractor and dehydrating, drying and pulverising the obtd. gel.

The extd. liq. is concd. to 2-3 times concn. in the process of gelling deposition without a vacuum concentrator. As the gel is formed in fine fibre, it has great surface and press dehydration time is reduced to 1/3-1/4 of the conventional process. As the gel is easily dehydrated, normal temp. soluble carragheenan can be mfd. with cheap equipment, simple operation and low mfg. cost.

As alkali metal salt, at least 1 of sodium salt, potassium salt, ammonium salt, calcium salt, magnesium salt, etc. is used. (2pp)

AJIN ★ D13 68764 D/38 ★ J5 6096-669
Animal feed for pigs, cows etc. - contains cyclic peptide Permetine A obtd. by culturing Bacillus circulans microorganisms, for excellent growth acceleration

AJINOMOTO KK 28.12.79-JP-172275

C03 (04.08.81) A23k-01/17 A61k-37/02

28.12.79 as 172275 (117RP)

Feeds, e.g., wheat, barley, starch, oil cake, fish powder, or others, contain 2-20 ppm cyclic peptide antibiotic Permetine A which is obtd. by isolation and refining from the culture liq. of Bacillus circulans. The feeds has not only excellent growth acceleration action on livestock, e.g., pig, cow, etc., but also can be used safely and continuously for a long time.

For example, Permetine A was refined and then mixed with a small amt. of corn starch powder. Then, various feeds contg. 2.0-20.0 ppm Permetine A were prepd. and used as feeds for chicken. Also, feeds contg. 10 ppm colistine were used for comparison. As a result, the growth of chicken fed with feeds contg. Permetine A was much more outstanding than those fed with feeds contg. colistine and controls. (2pp)

MAZN ★ D13 68767 D/38 ★ J5 6096-678
Sweetener prepd. by extn. of licorice with aq. alkali hydroxide soln. - and heat treating glycyrrhizin to give prod which does not gel at acidic pH

MARUZEN KASEI KK 28.12.79-JP-172494

B03 E13 (04.08.81) A231-01/22

28.12.79 as 172494 (42BZ)

A sweetener (I) contg. a cpd. (II), obtd. by treating at high temp. glycyrrhizin, (III) which is extracted from a licorice (IV), with aq. alkali hydroxide soln., is new.

(II) is prepared as follows; (1) root of (IV) is extracted with warm water, (2) pH of the extract is brought to about 2.0 by addn. of hydrochloric acid, to form a ppt. of (III), (3) 10N-NaOH soln. is added to the ppt. followed by heat-treatment at 120 deg.C for 30 min., (4) the soln. is mixed with a hydrochloric acid soln., after cooled, (5) thus formed ppt. is washed with water and dried, (6) the dried product is dissolved in KOH-soln., and (7) (II) is allowed to ppt. with addn. of alcohol.

(III) has a strong sweetness as 100-300 times high as that of sucrose, and therefore it has been used as a substitute of sucrose because of its low calories. But it forms gel when used in acidic pH range. (II) forms no gel in acidic pH range, although it is considered to be a cpd. having a structure similar to that of (III). The sweetness and taste of (II) are also similar to those of (III). (3pp)

HIGE- ★ D13 68768 D/38 ★ J5 6096-679
Seasoning soln. prepn. - by treating raw materials contg. protein with protease at high temp., then with peptidase and/or glutaminase at low temp

HIGETA SHOYU KK 29.12.79-JP-171849

(04.08.81) A23j-03 A231-01/22

29.12.79 as 171849 (42RH)

Raw material (I) contg. proteins is treated with a protease not contg., or contg. a slight amt. of, peptidase at a high temp., and subsequently with peptidase and/or glutaminase at low temp. The treatment of the first step is performed at 50-55 deg.C for 3-12 hrs., while that of the second step at 35-45 deg.C for 10-40 hrs.

Used to produce seasoning soln. (II) contg. a large amt. of glutamic acid. In this method, (1) the efficiency of glutamic acid formation is high, (2) various germs do not grow in the process, and (3) it is not necessary to use antifungal agent. (4pp)

KYOW ★ D13 68769 D/38 ★ J5 6096-680
Seasoning prodn. - by coating mixt. of sodium guanylate and organic acid with fat

KYOWA HAKKO KOGYO KK 28.12.79-JP-170391

E12 (04.08.81) A231-01/22

28.12.79 as 170391 (42RH)

A seasoning (I) is prepd. by coating a mixt. of sodium guanylate (II) (1 pt. wt.) and organic acid (III) (0.3-3 pt. wt.) with a fat having a m.pt. 40-90 deg.C.

(II) is used in fish meat-paste, ham, sausage, etc. with sodium inosinate and sodium glutamate. (II) must have phosphate group at 5'-position of ribose in purine-nucleoside in order to exhibit seasoning-effect. But the phosphate gp. is released by the enzyme present in meats, fish-meats, and vegetables, losing its seasoning effect. The present method prevents the enzymic decomposition of (II), when (II) is mixed with these foodstuffs.

Examples of (III) are fumaric acid, citric acid, tartaric acid, etc. Mixt. of (II) and (III) can be coated by the fat by one of the following methods. (1) the mixt. is suspended in a melted fat and the suspension is sprayed and cooled; (2) a melted fat is sprayed on the surface of the mixture. (5pp)

DAUC ★ D13 68770 D/38 ★ J5 6096-686
Food preservative compsn. - contg. zeolite absorbing one or more of (arabo ascorbic acid, its salt or their deriva.

DAIICHI SEIYAKU KK 27.12.79-JP-172416

(04.08.81) A231-03/34

27.12.79 as 172416 (42AT)

Zeolite (I) absorbing one or more cpds. (II) comprising one or more of ascorbic or araboascorbic acids, their salts and deriva. is new.

Prepn. of (I) comprises mixing zeolite with a soln. or suspension of (II). The wt. of zeolite used is 1-50 times that of (II). Before the treatment, zeolite should be calcined at 200 deg.C for about 2 hrs. As zeolite, both natural and synthetic zeolites are used.

(I) absorbing (II) is used for prevention of food-decomposition. (II) have been used as antioxidant for foodstuffs, but, are decomposed by heavy metal ions, aminoacids and other components in the foodstuffs, losing its antioxidant-effect. (I) controls the humidity in the food-contg. vessel, releasing (II) gradually, and preventing food-decomposition. (4pp)

TANA/ ★ D13 68887 D/38 ★ J5 6097-248
Water soluble calcium citrate-calcium malate composite prepn. - by adding calcium hydroxide or carbonate to malic and citric acid soln. or calcium chloride to sodium salt(s) soln.

TANAKA S 28.12.79-JP-173172

B05 E12 (05.08.81) C07c-51/41 C07c-56/24

28.12.79 as 173172 (59BZ)

Citric acid (up to 70 wt.%) and malic acid (at least 30 wt.%) are dissolved in water and Ca(OH)₂ or CaCO₃ is added to neutralise the soln. giving a water-soluble composite of Ca malate and Ca citrate in a wt. ratio of = 2:3. Alternatively, the composite may be prepd. by dissolving Na citrate (up to 70 wt.%) and Na malate (at least 30 wt.%) in water and adding a stoichiometric amt. of CaCl₂ to ppt. crystals.

The composite is soluble in water in an amt. higher by 590% than the sum of solubility of Ca citrate and malate. The composite is usable for replenishing Ca in vivo. (6pp)

TAKE ★ D13 68902 D/38 ★ J5 6097-298
Extraction and purification of glycyrrhizin - by contacting liquorice extract with polycondensate of aldehyde and aromatic amino cpd. and eluting with aq. alkali

TAKEDA CHEMICAL IND KK(MAZN) 28.12.79-JP-173818

13.09.78 as 009319 (913PW)

Anthocyanines are recovered from a water and SO₂ contg. extract of vegetable material by ultrafiltration to separate the monomeric anthocyanines in the filtrate from macromolecular material. Before the ultrafiltration process, the SO₂ content is determined and then maintained at 500-2000 (pref. 1000-1200)ppm.

The anthocyanines are natural colourants, giving shades from red to purple, and are used in liq. or solid foods and luxury foods, cosmetics and pharmaceuticals. (8pp)

Penicillin derivs. of formula (I) and their non-toxic, pharmaceutically acceptable salts (esp. Na or K salts) have been prepd. in the formula, X is O, S or SO; n and m are each 1 or 2, R₁

or 2,6-dimethoxy benzoyl; or R₁+R₂ are together a divalent residue esp. (hexahydro- 1H-azepin- 1-yl) methylene). (I) are prepd. e.g. by standard acylation of corresp. 6-NH₂ cpds.

(I) are broad-spectrum antibacterials useful as animal feed additives and therapeutically in human or veterinary medicine. They are esp. useful against gram-negative species which elaborate beta-lactamase. Bul. 47/23.12.80 (5pp)

FARH D13 08318 A/05 = SU-791-257
Treating microbial cellular mass with ammonia and alcohol solvent - to remove lipid and nucleic acid from protein food product

HOECHST AG 27.07.76-DE-633666
C03 E35 (23.12.80) *BE-857-229 + C12d-13/06
26.07.77 as 504953 (GW)

A process for reducing the lipid and nucleic acid content of a microbial cellular mass comprises treating with NH₃ or NH₄OH and a solvent of formula R₁-(CH₂)_n-OR₂ where R₁ and R₂ are H and n is 1-3, or R₁ is OH and R₂ is H, CH₃ or C₂H₅ and n is 2 or 3. After sepg. the liq. the residual cellular mass is washed with water and dried.

The process is used in the prepn. of protein material by fermentation used in food prods. and forage. Compared with previous purification processes, the purificn. is more complete, and it avoids the use of toxic solvents and the inconveniences of the high temp. alkaline sepn. Bul. 47/23.12.80. (4pp)

POUL= * D13 69258 D/38 ★SU-791-357
Prod. of artificial parthenogenesis in chickens - by activating thermally pretreated isolated large follicles and incubating in specified nutrient medium

POULTRY RES INST 19.06.79-SU-781767
C03 P14 (30.12.80) A01k-67
19.06.79 as 781767 (835VE)

The process is used in chicken stock with a low frequency of natural parthenogenesis as follows: follicles measuring 17-37 mm. are removed from a chicken and left in a warm flow at 45-46 deg.C. for 30-40 min. in presence of nutrient medium contg. 48-50% chicken protein in Hanks soln. The follicles are subsequently incubated in vitro in this medium.

Typically, all the large follicles were removed from 60 virgin white Leghorns and the surrounding membranes were removed. The follicles were placed in 40 mm. centrifuge tubes containing nutrient medium with added chicken protein (details are given). The tubes covered with cellophane film to preserve sterility, were warmed at 45-46 deg.C. for 30-40 min. on a water bath to activate the follicles. These were then incubated for 24 hrs. at 41.7-42 deg.C. and subsequently dried at 37.5-37.7 deg. C to 58-60% water-content. The success rate was 96% against 40-50% or even 0.1% in some strains. The procedure allows genetic studies to be conducted with a much reduced no. of tests. Bul. 48/30.12.80. (2pp)

SALT= * D13 69260 D/38 ★SU-791-364
Salt mixt. used as animal feedstuff additive - contg. limestone and magnesia from waste solids and brine from sodium chloride mfr.

SALT IND RES INST(LIVE=) 06.06.79-SU-776931
C03 (30.12.80) A23k-01/17
06.06.79 as 776931 (835VE)

The food value of salt mixt. is enhanced by adding CaCO₃ and Mg(OH)₂. The salt mixt. comprises (in wt.%): NaCl 70.5-79.5, Na₂SO₄ 9.2-13.7, Na₂CO₃ 0.5-0.9, CaCO₃ 10.0-14.5, Mg(OH)₂ 0.8-1.4. The salt is made by evapn. of waste from salt prodn. to give a dry solid. Before concn. 1 pt. sludge is mixed with 4-6 pts. mother brine.

Typically, 200 ml. sludge contg. (in g/l): CaCO₃ 217, NaCl 137, Mg(OH)₂ 20, Na₂SO₄ 2.6, remainder - water, are mixed with 800 ml. brine contg. (in g/l): NaCl 240, Na₂SO₄ 50, Na₂CO₃ 3.4, remainder - water. The slurry is dried to give a prod. contg. (in wt.%): NaCl 70.5, CaCO₃ 10.0, Na₂SO₄ 9.2, Mg(OH)₂ 0.8, Na₂CO₃ 0.5. Tests indicated that the proposed salt was less toxic than pure NaCl when used with cows and pigs.

By using salt purification waste, the presence of unsightly dumps from salt production could be avoided, and animal salt could be made from low cost material. Bul. 48/30.12.80. (3pp)

VITE = ★ D13 69261 D/38 ★ SU-791-365
 Prodn. of cattle feed additive - from milled grain and urea using tripolite as plasticiser during extrusion

VITEB AGRIC STATION 05.09.77-SU-522131

C03 (30.12.80) A23k-01/22

05.09.77 as 522131 (835VE)

Cattle feed is improved by mixing milled grain with urea and a plasticiser, after which the product is passed through a press-extruder. Costs are reduced and the efficiency of the additive is raised by using as plasticiser, precipitated tripolite.

Tripolite is similar to Na-bentonite in its props., e.g. porosity, moisture capacity, plasticity. Both materials are similar in composition and are used to purify syrups, vegetable oils and fruit juice. The cost of 1 t. tripolite is however 4 times less than 1 t bentonite. (2pp)

DONS = ★ D13 69262 D/38 ★ SU-791-366
 High nitrogen, additive for ruminant feedstuff prodn. - by treating urea and hydrocarbon oil cultivated yeast mixt. with aq. formaldehyde soln. for low toxicity

DONSK AGRIC INST 07.03.79-SU-733924

A97 C03 (D16) (30.12.80) A23k-01/22

07.03.79 as 733924 (835VE)

The total N-content is raised and toxicity eliminated if aq. urea soln. before HCHO treatment, is mixed with nutrient yeast biomass cultivated on hydrocarbon oils. The liquid is mixed with HCHO at 25-50 deg.C, pH 3-5. The wt. ratio of urea:nutrient yeast:formaldehyde:water is 4:1-1.5:1.5:5.

Typically, 120 g. urea, 100 ml. water and 30 g. nutrient yeast are heated to 25 deg.C., after which 80 g. 37% HCHO are added. The soln. is stirred continuously until the temp. falls to 40-50 deg.C. and 1 ml. (1.19) HCl is added. The product hardens and the temp. rises to 80 deg.C. with loss of some water. Bul. 48/30.12.80 (3pp)

 Animal feedstuffs prodn. - by dividing material into coarse and fine fractions, treating former with alkali and latter with molasses before mixing in screw-mixer

RANCH FODDER EQUIP(AGRI =) 03.08.79-SU-805454

C03 (07.01.81) A23k-01

03.08.79 as 805454 Add to 676264 (29MI)

Method for manufacturing animal feedstuff mixtures, according to Parent Cert. No. 676264, where the mixt. of dry ingredients was divided in accordance with the granulometric composition using a flow of air. This resulted in coarse and fine fractions, with the liquid ingredient added to the latter to form a mixture, to which the coarser fraction was added subsequently and the final mixture pressed. The nutritional values of the mixture are increased by treating the coarse fraction with an alkaline soln. prior to mixing it in with the fine fraction. (2pp Dwg.No.1)

RETR/ ★ D13 69601 D/38 ★ US 4286-884
 Appts. for continuous hydrolysis of keratinous material - with heated vessel operated at atmospheric pressure and further heated pressurised vessel

RETRUM R 10.01.80-US-110950 (11.12.78-US-968479)

C03 (01.09.81) A23j-01/10 B01f-07/04 C07g-07

10.01.80 as 110950 (295AS)

Keratinaceous material is continuously hydrolysed as described in the Parent Patent. It is effected using an appts. which consists of a first vessel where the material is violently agitated by paddles which rotate at 150-350 rpm. The material in the vessel is heated to a temp. less than 212 deg. F and without any significant pressure build-up.

A pump connects the outlet of the first vessel with a second vessel where the material is further agitated, heated to 265 to 365 deg. F and subjected to a pressure of 25 to 150 psig. The pump prevents escape of pressure from the second to the first vessel. A further pump discharges the hydrolysed material and some pressure from the second vessel.

Appts. is efficient, controllable and fully continuous to produce a fodder of improved nutritional value from feathers, hair, nails, etc. (10pp)

FMCC ★ D13 69665 D/38 ★ US 4287-058
 Fruit juice sepn. from slurry of pulp and seeds - by cylindrical screen and auger with controlled back pressure (BR 16.6.81)

FMCC CORP 04.12.79-US-100174

P41 (01.09.81) B01d-25/38 B04b-01/20 B04b-03/04

04.12.79 as 100174 (295AT)

A sepg. appts. comprises a cylindrical screen in which an auger is rotated to advance a slurry from an inlet end of the screen. At the downstream end of the appts. is a discharge port selectively closed by a valve to adjust the back pressure in the appts. The auger presses the liq. phase of the slurry through the screen while the solids residue is discharged through the valved port.

At the downstream end of the auger is an extension carrying paddles which direct the solids to the discharge port which is located on a non-perforated portion of the screen which surrounds the paddles. A stripper plate is associated with the port to remove debris from the paddles.

The appts. recovers fruit juice from a mixt. of juice, pulp and seeds. It may also remove particulate pulp from a wash. The appts. does not use a fixed aperture discharge port to produce the required back pressure. This eliminates the problems of the fixed aperture becoming blocked by seeds. (9pp)

WESTFALIA SEPARATOR AG 04.03.80-DE-008132 (00.00.77-DE-750787)

(D16) (10.09.81) A23n-04

04.03.80 as 008132 Add to 2750787 (39BZ)

The Parent Patent No.2750787 described a machine for the continuous separation of the flesh of fruits from the skin, specially for grapes in the wine production, by a rotor with radial hammer heads, surrounded by a centrifuge basket. It is now suggested to run the centrifuge basket at a slower speed than the hammer heads, at a ratio varying from 2:1 to 4:1. Both revolve pref in opposite directions; a scanning device cuts out first the hammer mechanism and then the basket when the speed becomes excessive.

This creates an adequate difference between the peripheral velocities of basket and hammers to peel off the skin, but keeps the hammer velocity low enough not to crack the pips. (17pp)

28.06.69 as 077647 /73 Div.ex.051328/69 (83HM)

Method comprises mixing powdery material (I) with soln. of cpd. (II) capable of generating gas by heating, granulating the mixt., and heating the wet granules by microwave of 500-3500 MC.

(I) is e.g. BaSO₄, AlSiO₃, instant coffee, powdered milk, etc. (II) is e.g. NaHCO₃, yeast, etc. The solvent for (II) has pt. lower than m.pt. of (I), and is e.g. water, (m)ethanol, chlorinated hydrocarbons, etc. The granulation can be carried out by any of usual methods. It is pref. to spray the mixt. into microwave heating chamber. The heating time is 0.1-10 min.

Used for prodn. of medicines, instant foods, etc. The granules have fine porous structure and can be dispersed or dissolved in water rapidly. (2pp)

(24.06.81) C02f-11/14

07.05.79 as 212681 Add to 140244 (200HM)

This is a Patent of addn. to 140244, which discloses a continuous clear sludge or liq. manure decomposition process by opt. thermolysis, enzyme treatment and prod. separation into stabilised sludge and a liq. phase. Improvement is that the enzymes are added consecutively in a defined sequence.

The enzymes can be proteases, brewery enzymes, lipases, amylases and celluloses. Enzyme treatment takes 5-180 min. at 10-60 deg.C and pH 6-9. Enzyme conc. is below 0.5 (0.1-0.5)%, w.r.t. dry wt. of organic cpds. to be degraded. Stabilised sludge quality is improved by aeration.

Enzyme treatment time is shortened, e.g. to 20 min. to 2 hrs. depending on enzyme. Enzyme quantity added is reduced. The process can be extended to prim. sludge treatment, is opt. continuous or intermittent and smell is reduced. (5pp)

Small farmyard manure gas plant - using hand pump instead of motorised paddle mixer

WEBER F 26.02.80-DE-007064 (00.00.77-DE-711146)

P11 (D16) (10.09.81) A01c-03/02

26.02.80 as 007064 (39AT)

The Parent Patent No. 2711146 described a farmyard manure gas plant of small enough size to be suitable for single farms. To make this system independent of any electric power, the paddle mixer in the manure fermentation pit, driven by an electric motor, is now replaced by a hand pump which is built into the pit at an angle and is also used to feed straw, grass and other waste into the pit.

This makes the system more suitable for farms in remote localities or in developing countries. (6pp)

 Flotation system and appts. - uses bell-mouthed nozzle with conical deflection element

BAYER AG 05.03.80-DE-008476

F09 J01 P41 (09.09.81) B03d-01/14 C02f-01/24 C02f-03/12

26.02.81 as 101402 (39DH) (G) No-Citns. E(AT BE CH DE FR GB LI NL)

In a flotation system, the pulp is passed in the flotation cell through a bellmouthed nozzle. A conical deflector element is arranged in the centre line of the fluid jet to produce a mixture with the gas (air) which is drawn in through the annulus. The floats are extracted in counterflow to the liquid.

Useful in the chemical industry, e.g. for the flotation of dye pigments or for de-inking of waste paper, in the sewage treatment for the removal of biosludge from biologically treated effluents. The nozzle achieves very fine gas bubbles with a minimum of turbulence and without impellers. It is simple and has two adjustable parameters, the gas flow rate and the liquid flow rate. (25pp)

 Liquid farmyard manure treatment - in algae-bacteria culture tank followed by rotifera culture tank at specified pH value

KERNFORSCHUNGS JULICH 04.03.80-DE-008127

+P14 (09.09.81) A01k-67 C02f-03/32

28.02.81 as 101469 (39RH) (G) DE2519887 DE2655614 DE2259788 E(DE FR GB IT NL)

Liquid farmyard manure is treated in two stages. A first stage with a mixed algaebacteria culture is followed by a second cleaning stage, using a rotifera culture. The former takes place in open-air basins and lasts 3-6 days at an average temp. of 18 deg.C. The pH-value of this culture is controlled (over 8.5) to prevent any increase in the rotifera population. The treatment in an aerated rotifera tank lasts 2-4 days (6-8 pH). The rotifera are finally sepd. from the clean liq.

This creates a reliable method which requires no toxic flocculants or power-consuming separators. The separated rotifera are excellent foodstuff for fish. (3pp)

 Water softening filter esp. for domestic coffee making machines - employs ion exchange resin regenerated periodically with household salt

OFF CIMBALI GIUSEPP 08.02.80-IT-020740

P28 (14.08.81) A47j-31/44 C02f-01/42

23.12.80 as 027334 (448AS)

A small water softening/purificn. unit partic. for a domestic coffee-making machine, comprises a filter element in the form of a casing packed with ion exchange resin. The element has an outlet connection which is removably coupled to the water inlet of the machine. The inlet port of the element is immersed in water in the machines water tank.

Pref. the resin is retained in the casing between one perforated screen at the outlet end and a second perforated screen at the inlet end. For regeneration of the resin, the element is removed from the tank, inverted, and placed beneath a water tap. A quantity of sodium chloride is palced in a funnel on top of the inlet screen. Tap water is run through the funnel to dissolve salt and carry it through the resin. This back-flushing also cleans the resin.

Used for softening water partic. to prevent scale formation in the boiler of a coffee making machine. The softener is small

enough and cheap enough to be viable for fitting inside the water tank of domestic coffee making machines. (8pp)

Cleaning semi-cylindrical screen with rotating scraper - with spring loaded rakes on radial arms

LONGWOOD ENG CO LTD 09.03.78-GB-009292
(16.09.81) C02c-01/22

09.03.78 as 009292 (295BZ)

A semi-cylindrical screen is constructed from semi-circular bars. The bars are cleaned by a rotating scraper assembly which carries a set of rakes which contact the screen bars. Each rake is pivoted to the scraper arm and is biased by a coil spring to contact the screen. If an obstruction is encountered, the rake yields against the bias of the spring.

In an embodiment, the scraper assembly has two diametrical arms, each of which carries a set of rakes.

The appts. cleans a screen used in a storm water overflow. If any of the rakes encounters an obstacle, it yields but the other rakes remain in contact with the screen. (5pp)

LONG-★ D15 68419 D/38 ★GB 1598-130
Clearing inclined screen bars by scraper - with independent rakes yielding on contact with obstruction

LONGWOOD ENG CO LTD 16.03.78-GB-010429
Q42 (16.09.81) B01d-35/28 E03f-05/14

16.03.78 as 010429 (295AS)

A screen composed of an array of parallel bars inclined to the vertical, is cleaned by a scraper assembly which is reciprocated vertically over the bars. The scraper has typically 3 independent rakes which are mounted on a common frame which is reciprocated. The frame tilts on the downward stroke to move the rakes out of contact with the bars but on the upward stroke the rakes contact the bars unless an obstruction is met.

If any rake is obstructed, it pivots on the frame to bypass the obstacle while the other rakes remain in contact with the bars. Gravity acts as the bias to hold the rakes against the bars. Counterweights can be attached to the rakes to increase the bias.

Appts. removes debris from the screen of a pumping station. An obstruction due to a tree branch at one part of the screen does not affect the cleaning of other parts. (6pp)

 Aggregating agent composite - comprising fibres, polymer type-aggregating agent and as wetting agent, a water-soluble solvent

NICHIREKI KAGAKU KO 30.12.79-JP-171494

A97 J01 (06.08.81) B01d-21/*

30.12.79 as 171494 (51RH)

The composite consists of a fibre, a polymer type aggregating agent, and a wetting agent. The wetting agent is a water-soluble solvent consisting of at least 1 of liquid polyethylene glycol, methanol, ethanol, propanol, or butanol. The fibre consists of asbestos, glass, wool, cotton, paper, pulp, polyester, polyamide, polypropylene, or polyvinyl chloride.

Its prodn. comprises wetting the fibre with the wetting agent to obtain a wetted fibre, and mixing the wetted fibre with a powder of the aggregating agent to produce the aggregating agent composite.

When the aggregating agent composite is added to water, dispersion of the fibre contained in the composite and dissolution of the aggregating agent contained therein are rapidly carried out.

In an example polypropylene fibre was mixed with polyethylene glycol to obtain a mixt. A cation system polymer type aggregating agent was sprayed to the mixt., and mixed with it to produce an aggregating agent composite. (5pp)

The water desalination plant comprises a vertical cylindrical column with a topmost first evaporation stage supplied with primary steam and preheated seawater, and a lowermost and last such stage with condensate and concentrate outlets. Between these stages are intermediate ones, each with a supply tank. The preheated seawater discharges into the first stage tank. Each stage contains tubes mounted vertically in a steam chamber between top and bottom plates to form a surface evaporator, leading from the tank to a separation chamber below.

Each separation chamber is connected via a drop separator to the steam chamber of the stage below, each stage having a heat exchanger in the seawater feed pipe forming a preheater. In each intermediate stage, there is a single surface evaporator whose tubes fit in a bottom plate extending for the entire column width, and lead into a vessel secured at the top to this plate and at the bottom to the top plate of the next stage. The vessel is divided by a wall with liquid apertures into a separation chamber for the lower tube ends and which is connected via the drop separators to the steam chamber of the next stage; and into a liquid tank underneath for the evaporator of the next stage. The preheater in each intermediate stage is in a pipe running diametrically through the tank and connected to the next stage steam chamber at each end. (4pp)

Unit for measuring micro-concn. of chemical reagents in natural water - uses sensors to detect change in conductivity between natural water and water with salt impurities added

SEMENOV R V 08.01.79-SU-710333
J04 S03 (30.11.80) G01n-27/22
08.01.79 as 710333 (1503GW)
The device is concerned with the measurement of the conductivity of natural water and with the protection of the environment. To increase sensitivity and accuracy of measurement, the comparison sensor includes an alternate capacitance, which only switches in the operating mode. The unit consists of a four-armed bridge, measuring sensor (1) comparison sensor (2), resistances (3,4), amplifier (5), automatic recorder (6), reversible motor (7), rheochord (8), resistance sensors (9,10), and variable capacitance (11).

A flow of natural water through both sensors causes an equilibrium and a disbalance signal of zero in the measuring diagonal. Water with added salt components then flows through the measuring sensor and the change in the conductivity causes a disbalance signal, which passes via amplifier to the recorder. By means of the motor the rheochord re-establishes the equilibrium in the bridge. The increase of the specific conductivity of the liquids brings about a difference in their active resistances. A capacitance resistance, equivalent to the capacitance resistance of the measuring cells, is created in the variable capacitance (11), and by differential methods the conductivity is calculated. Bul. 44/30.11.80. (2pp Dwg. No. 1)

 E14 (30.12.80) C02f-01/24
 01.03.79 as 734642 (114VE)

Waste water from crude benzene prodn. (from coke oven gas) is subjected to flotation-purification to ensure simultaneous removal of benzene, phenol and sulphide cpds. by using permanganate peroxide flotation reagent in alkaline medium.

The proposed treatment gives: oxidn. of (in)organic impurities into gaseous prods.; formation of Mn-oxide flocs (which adsorb oil, benzene, alcohol and phenol); catalytic decomposition of peroxide cpd. giving active O; carbonisation of sulphides by CO2 gas (prepd. by oxidn. of impurities, oils etc.). The waste prods. may be blown away. The oxidn. process takes place throughout the entire waste water and so accelerates the purification process. (3pp)

DNEP = ★ D15 69323 D/38 ★ SU-791-613
Flotation-purification of waste water from benzene prodn. - by permanganate and peroxide cpds. treatment using activated silicic acid flocculant

 Multistage flash evaporator for brine - flowing through vertical stages with countercurrent vapour from flashing units

STANDIFORD FC 26.09.80-US-191446 (12.09.75-US-612736)

J01 (01.09.81) B01d-01/06

26.09.80 as 191446 Add to 612736 Div ex 12-09-75 (295)

A stack of multiple evaporator stages is configured as a tower which receives brine at its upper end. The brine falls through vertical tubes which pass through each stage and act as heat exchangers to heat the brine before it enters a sump at the base of the appts, where it is further heated by a boiler. Hot brine is drawn up through successive riser tubes by centrifugal rotors to enter the evaporator sections of the various stages.

Each stage includes a condenser formed by the vertical brine feed tube. The stages are operated at successively decreasing pressures so that the hot brine is flash evaporated. (16pp Dwg.No.1)

 Water conditioner with axially movable filter beds - having weight-activated device producing signal to indicate necessity of recharging

STANLEY BF 02.09.80-US-183320

(01.09.81) C02b-01/64

02.09.80 as 183320 (295AS)

A rechargeable water conditioner has a weight responsive device indicating when a recharge is necessary. It consists of a container with inlet and outlet, two separate filtering and conditioning media, and three screens.

The weight responsive device is positioned beneath the media and screens, and senses when a predetermined mass of sediment has been added through the deposition of material filtered from the water. The device then activates a signal to indicate the need for recharging which is effected by a reverse flow of fluid through the conditioner.

Appts. is compact and may be used domestically. (5pp)

The appts. which is contained within a light-proof housing consist of a support for a multi-well plate, with an opaque grid the compartment walls of which individually surround the transparent wells in the multi-well plate preventing light intersection between adjacent wells in the eight by twelve well matrix.

Situated in a singleline above the well plate is a bracket carrying eight injector tubes. At an appropriate point, when positioned over a row of wells, the stepper motor driven reciprocating mechanism lowers the injector tubes into the wells and peristaltic pumps inject a controlled amount of liquid into each well in the tow. The injectors are then raised again. A lower antilever arm houses a row of photocells in close proximity to the underside of the transparent well bottoms.

The injectors and photocells are index forward one row at a time by the motor driven lead screw mechanism so that in turn all wells are covered. The photocells measure the luminescence produced in each individual well and their signals feed via high gain amplifiers to a data processing unit. (21pp)

Antibiotics X-14868A-D of formula (I) (A-B) and their salts are new, (either (1) X₁ is Me, X₂ is ---Me, X₃ is absent and R is H, or (2) X₁ is absent, X₂ is -Me, X₃ is Me and R is Me, respectively). The X-14868C melts at 172-5 deg.C (Na salt), gives a microanalysis of 57.12% C, 8.58% H and 2.36% Na, and has characterising i.r. spectrum and specific rotation. The X-14868D melts at 194-5 deg.C (Na salt) gives a microanalysis of 60.32% C, 8.80% H and 3.40% Na and has characterising i.r. spectrum and specific rotation.

The antibiotics are active against certain Gram-positive bacteria and so are sterilising agents and they show anticoccidiostatic activity. X-14868A improves ruminant feed utilisation and prevents and treats ketosis, and it is active against *Treponema hyodysenteriae*, the etiologic agent of swine dysentery. (80pp)

Producing plants inoculated with symbiotic mycorrhiza - by transfer from pre-inoculated pilot plants, useful e.g. for truffle prodn.

PEGASUS PENSION FUN 18.02.80-IT-067244

P13 (09.09.81) A01g-07 A01h-17

13.02.81 as 200172 (1251AT) (F) FR1408517 E(AT BE CH DE FR GB LI LU NL SE)

Prodn. of plants contg. symbiotic fungi as mycorrhiza, comprises first growing a series of plants in sterile soil, then contacting their roots with roots from another plant already naturally inoculated with the fungus. The treated ('pilot') plants are then planted in sterile soil. Separately, sec. roots contg. fungi other than the required species, are removed from adult plants, the remaining roots sterilised, then the plants placed next to the 'pilot' plants so that they become inoculated with the fungus.

Pref. the first set of plants are raised from seed, and the 'pilot' plants are planted, esp. in autumn, in a greenhouse or nursery bed about half a meter apart.

The adults plants will rapidly produce fruiting bodies once inoculated with the fungus, and any type of symbiotic fungus can be used e.g. *Tuber* species (truffles), *Boletus* species, *Amanita caesarea* or *Lactarius deliciosus*. (9pp)

REGC ★ D16 68307 D/38 ★EP --35-384
Deoxy nucleotide linkers for cloned DNA coding sequences - facilitating cleavage, solid-phase purificn. and/or ribosomal binding

UNIV OF CALIFORNIA 29.02.80-US-125878

(09.09.81) C12n-15

27.02.81 as 300826 (367BZ) (E) No-Citns. E(BE CH DE FR GB IT LI NL SE)

The following are claimed: (A) a specific cleavage linker comprising a DNA sequence (I) coding for a sequence of one or more amino acids which is specifically recognised and cleavable by enzymatic or chemical means; (B) a specific purificn. linker comprising a DNA sequence (II) coding for an amino acid sequence which is selectively bindable to a solid-phase material; (C) a ribosomal binding site linker comprising a DNA sequence (III) which is homologous to the 3'-end of 16S ribosomal RNA, and a DNA sequence (IV) comprising 3-11 deoxynucleotides, (IV)

being joined to (III); (D) a composit linker comprising a DNA sequence (V) having a restriction site which is recognised and cleavable by a restriction endonuclease, a sequence of type (III), a sequence of type (IV), a sequence (VI) having the initiation codon, a sequence of type (II) and a sequence of type (I), where (V), (III), (IV), (VI), (II) and (I) are joined together in the direction of translation.

Sequences of type (I) coding for an amino acid sequence cleavable by enterokinase are 5'-(GAL)n-AAJ-3' or 5'-(GAL)n-WGZ-3' (where L is A, T, C or G; J is A or G; W is A if Z is A or G, or W is C if Z is A, G, C or T; Z is A, T, C or G if W is C, or Z is A or G if W is A; n = 2-4). Linkers contg. (I) pref. also have a restriction site, esp. the sequence 5'-CCAAGCTTGG-3' for HindIII endonuclease.

Sequences of type (II) may code for a polyanionic, polycationic or hydrophobic amino acid sequences or for an immunogenic peptide. Specified sequences are 5'-(GAL)m-AAK-(GAL)n-AAJ-3' (where K is T or C and m is 1-4).

Linkers of type (C) can also contain a termination codon and/or a promoter segment. Specified linkers contain the sequences 5'-(L) TAGGAGGA(L) -3', 5'-(L) TAGGAGGATCAATTCC-3' or 5'-TATJATJAGGAGGA(L)m-3' (where p is 0-2 and q is 3-11). (41pp)

A vaccine complex consists of bacterial ribosomal RNA, or its fragment, to which is coupled 1-5 wt.% of an antigen specific for a bacterial serotype. The RNA and the antigen can be derived from the same or different bacterial strains.

The pref. antigens are capsular polysaccharides (CP); membrane lipopolysaccharides (MP) from Gram negative bacteria; specific membrane proteins (SMP), and teichoic and lipoteichoic acids (TA) from Gram positive bacteria. The pref. RNA fragments have mol. wt. 30000-50000 and the components are coupled by covalent bonds. Vaccines contg. these complexes are also new.

When coupled to RNA, very small amts. of antigen will induce a satisfactory immunostimulant response. The problems of toxicity associated with large doses of such antigens are thus avoided. (34pp)

Enzyme electrode using oxygen consuming enzymes - comprises oxygen electrode with electrolytic oxygen generation to maintain constant activity

ENFORSSO 05.03.80-SE-001711

J04 S03 (09.09.81) C12m-01/40 C12q-01/26 G01n-27/30

20.02.81 as 850029 (1251KB) (E) No-Citns. E(AT BE CH DE FR GB IT LI NL)

An enzyme electrode comprises an oxygen electrode (OE) having immobilised on, or near, its sensitive surface at least one enzyme, and an anode placed close to the enzyme so that oxygen consumed in the enzymatic reaction is replaced by electrolytic oxygen.

between the OE signal and a reference signal measured by a separate (enzymatically passive) OE, or (b) by the difference between the enzyme electrode signal and a constant reference value. The enzymes esp. include oxidases or oxygenases.

The electrodes are esp. used to assay glucose and other sugars, but other electrodes can be designed where the OE serves as a base sensor (e.g. alcohol, cholesterol or uric acid electrodes). Since the supply of oxygen is not limiting (as it is in known systems) the measuring range of the electrode is greater; the limiting factor is now the enzyme activity but even this limit can be increased by using a membrane of reduced substrate permeability. The oxygen-prodn. rate is automatically controlled to maintain the same oxygen activity in both electrode and sample. (10pp Dwg.No.1)

B04 C03 S03 (09.09.81) A61k-31/73 A61k-45 C07g-07 C07g-17 C12q-01/04 G01n-33/54

05.03.81 as 850035 (1248) (E) No-Citns. E(AT BE CH DE FR GB IT LI NL SE)

Therapeutic and diagnostic compsn. comprises an active constituent contg. a structural element (I) of formula alpha-D-Galp-(1-4)-D-Gal pref. in the terminal posn.

The compsn. has the ability to replace the normal receptor function in vivo in relation to pathogenic bacteria causing infections in man and animals. It is useful for (a) diagnosis of proneness to bacterial infection, antibodies against the receptor being generated and reacted with mammalian test cells; (b) purifying the acceptor structures of bacteria by using the affinity between the structural element and the acceptor structures on the bacteria; (c) identifying bacteria having receptor structures recognising the structural element; and (d) therapeutic treatments.

Pref. compsns. have structural element e.g. of formulae (II)-(V).

alpha-D-Galp-(1-4)-beta-D-Galp (II) alpha-D-Galp-(1-4)-alpha-D-Galp (III)

alpha-D-Galp-(1-4)-alpha(beta)-D-Galp-1-OR (IV) alpha-D-Galp-(1-4)-beta-D-Galp-(1-4)-D-Glc (V)

(R is an organic residue attached to the alpha or beta-configuration). These elements are coupled to macromolecular carriers, e.g. polypeptides, polysaccharides and other polymers, through spacing gps. such as p-O-C₆H₄-NHCSNH or p-NH(CH₂)₂-C₆H₄-NHCSNH gps. (26pp)

CHAT/ ★ D16 68371 D/38 ★FR 2475-524
Digester to produce methane gas from organic waste - fermented in plastic lined channel warmed by solar panels

CHATELAIN M 08.02.80-FR-003100

P11 (14.08.81) A01c-03/02 C02f-11/04

08.02.80 as 003100 (448BZ)

The digester comprises an anaerobic digestion channel which is loaded with organic matter at one end. The matter flows continuously along the channel and is discharged, after fermentation, at the other end. Pref. at intervals along the channel, recycling pumps extract fermenting material from just below the surface and reinject this material near the base of the channel at a point upstream of the extraction point.

The channel is pref. in the form of a tubular sleeve of plastic sheeting into which pipe couplings are bonded for connecting to the recycling pumps. The tubular sleeve is pref. encased in a metal framework extending along and on top of a drainage

The channel is pref. aligned in an east-west direction. Solar panels for heating the channel can be resited freely on the south-facing, top edge of the channel to form a lean-to shelter. The shelter may be used to house pumps, control gear etc.

Prodn. of methane gas from organic waste which can be used as agricultural fertiliser after fermentation. (13pp)

Quantitative testing of wine for suspected chaptalization - by comparing distillate specific gravity with reference samples of similar wine

HOLTZINGER G M G 12.02.80-FR-003016

S03 (14.08.81) G01n-09/18 G01n-33/14

12.02.80 as 003016 (448DJ)

The evaluation is made by comparing the wine with reference samples of named wines. Each reference sample is identified with type of vine, soil quality, hours of sunshine, humidity conditions and ripeness of grape. A statistically representative sample of the grape harvest is made, spread over the harvest period.

Pressing and fermentation follow according to the methods in use for the particular wine. The samples result from progressively increasing additions of sugar. The alcohol content of the distillate of each reference sample is measured, and the wine to be tested is matched to a reference sample. The saccharometer is graduated so that sugar quantity added to the wine can be read directly from the scale.

Used for checking a wine to determine if it has been chaptalized, i.e. sugar has been added to must prior to fermentation in order to raise artificially the alcohol content of the wine. Simple, rapid testing which reveals accurate quantitative evaluations of suspected chaptalization. (7pp)

Brewing process is as follows (a) a high-gravity liq.(I) is mixed with a low-gravity liq.(II); and (b) the mixt. is fermented to give a beer of original gravity 6-9 deg. of Plato (deg.P). (I) is a fermenting wort of original gravity 11-13 deg.P which has passed

Step (a) (I) may be prepd. from malt, or malt contg. 0-50% prer. 0-40% by wt. adjunct (rice, starch, etc) and pref. has original gravity 16-20 deg.P. (I) opt. may contain hops, and is from a mash which is opt. the same as the one from which (II) is prepd. (e.g. by dilution). (II) pref. has original gravity 4-5 deg.P; total N-content at least 30mg/100g; and formol N-content at least 9mg/100g. Any conventional (opt. fermenting) wort may be used. The mixt. to be fermented contains (I):(II) in vol. ratio 1:2-5.

Process affords a beer of low original gravity which has a flavour comparable to that of regular beers. (6pp)

Ribonucleic acid prepn. - by culturing *Bacillus* microorganism which is sensitive to surfactant in liq. culture medium

UEDA S 28.12.79-JP-171926

B04 (04.08.81) C12p-19/34 C12r-01/12

28.12.79 as 171926 (5KB)

Method comprises culturing *Bacillus* microorganism which is sensitive to surfactant and produces ribonucleic acid, in liq. culture medium and recovering ribonucleic acid accumulated in the culture medium. Ribonucleic acid is used as the starting material for sodium 5'-inosinate and sodium 5'-guanylate.

The varieties can be derived from the parent strains such as *Bacillus subtilis* IFO3214 through conventional mutation-inducing means. An example of the variety is *B. subtilis* N-32, FERM-P5335 (sensitive to sodium dodecyl sulphonate). The sensitivity to surfactant means that the variety is more bacteriolised than the parent strain in the bacterial suspension contg. surfactant. (3pp)

Ferredoxin prodn. from *Thermus thermophilus* microorganism - by culturing the bacterial strain mashing obtd. body and sepg. out prodn., useful for activating cellular metabolism

MITSUBISHI CHEM IND KK 27.12.79-JP-171721

B04 (04.08.81) C12p-21 C12r-01/*

27.12.79 as 171721 (5RP)

The method is effected by mashing bacterial body of *Thermus thermophilus* and separating thermo-resistant ferredoxin stable at 67 deg.C from the mash.

T. thermophilus HB8(ATCC 27634) and *T. thermophilus* HB27(FERM-P5160) can be used. The bacterial strain is cultured at 75 deg.C for 6 hrs. and bacterial body is collected at the later logarithmic phase. Then the bacterial body is treated with supersonic wave for mashing. Thus obtd. ferredoxin has mol. wt. ca. 10000, IEP at pH 3.1 at 4 deg.C, sharp peak at 283 nm and wide maximum absorption at ca 400 nm, is stable at 67 deg.C for 45 mins. and at pH 3.5-9.0 and shows higher activity than spinach ferredoxin.

Ferredoxin is low molecular protein which contains Fe atom and inorganic sulphide and serves as electron transporter. It is useful as activator for cellular metabolism. (4pp)

Colorimetric determ. of enzyme activity - using NADH reagent to react with pyruvic acid released by enzyme activity on substrate e.g. l alanine

SHIMADZU SEISAKUSHO KK 27.12.79-JP-172380

B04 (04.08.81) C12q-01 G01n-21/75

27.12.79 as 172380 (5BZ)

The method is to determine micro-amt. of enzyme by rate assay consists preparing the first standard soln. of enzyme substrate (a) the reagent (c) for reaction product (d) of (a) and (b) that is absorbent, the enzyme (e) for the reaction between (c) and (d) and known amt. of (d) in water. A second standard soln. similar to the first by with vol. of water instead of (d) is prepared. The absorbency of the first and second standard soln. are measured and the equipment constant is calculated from the difference between their absorbency. (5) The test soln (e) as the second standard solution is prepared by using the same amt. of the liquid sample contg. the enzyme (b) to be tested instead of water, and its absorbency measured against the second standard soln. and the activity of the enzyme is calculated from the difference between their absorbency and the equipment constant.

In the case of determining the activity of GPT (glutamate-pyruvate- transaminase) L-alanine and alpha- ketoglutaric acid are used as the substrate (a). The reaction product (d) is glutamic acid and pyruvic acid and pyruvic acid is reacted with the reagent (c) of NADH at the presence of the enzyme (e) of LDH to form lactic acid. The activity of GPT can be determined by

SHMA ★ D16 68775 D/38 ★ J5 6096-699
Determining activity of micro-amts. of enzyme - by preparing two standard solns. and using them to calculate equipment constant, measuring absorbency of test soln.

SHIMADZU SEISAKUSHO KK 27.12.79-JP-172381

B04 (04.08.81) C12q-01 G01n-21/75

27.12.79 as 172381 (05AT)

Determination of a micro-amt. of enzyme through a rate assay is characterised by (1) prepg. a first standard soln. by dissolving the substrate (a) for the enzyme (b) to be tested and adding (c) which is the reaction prod. between (a) and (b) and shows absorbency as the standard substance in the soln., (2) prepg. the second standard soln. as the first standard soln. but with adding the same vol. of water instead of (c), (3) measuring the absorbency of the first and the second standard soln., (4) calculating the equipment constant from the difference between their absorbency, (5) prepg. test soln. (d) as the second standard soln. using the same vol. of the liq. sample contg. the enzyme (b) to be tested instead of water, (6) measuring the absorbency of the test soln. (d) and the second standard soln. and (7) calculating the activity of the enzyme from the difference between their absorbency and the equipment constant.

By this method the activity of enzymes e.g. ALP, gamma-GTP, CHE, LAP, CPK, etc. can be determined using p-nitrophenol, 5-amino-2-nitrobenzoic acid, choline, p-nitroaniline and glucose-6-phosphoric acid respectively as the standard substance (c).

The activity of enzymes can be determined correctly through the simple process. (4pp)

Determn. of presence of analyte in sample is described, the

analyte being a member of a specific binding pair consisting of ligand and antiligand. A detectable signal is obtd. related to the amt. of analyte by employing a signal producing system comprising and enzyme labelled specific binding member and a polyionic charged specific binding member which attracts an oppositely charged molecular substrate or cofactor. The detectable signal level is related to the average proximity of the charged member to the enzyme labelled member.

Method comprises combining in an aq. assay medium, (1) the sample, (2) the charged specific binding member, (3) the enzyme labelled specific binding member and (4) substrates and cofactors for the enzyme. At least one substrate or cofactor is a charge macromolecule of opposite charge from the polyionic charged material. At least one of (1), (2) and (3) is a ligand and at least one of the remainder is an antiligand, so that a complex may be formed between the two binding members. The detectable signal produced by the enzyme as compared with a known signal is determined.

Method is used to determine drug or other component present in very small quantities. (17pp)

Eucaryotic cells co:transformed with DNA linked to promoter - useful for enhanced prodn. of proteinaceous materials

AXEL R 25.02.80-US-124601

B04 (03.09.81) C12n-05 C12n-15 C12p-21

23.02.81 as U00239 (1248RH) (E) 11Jnl.Ref N(AU BR DK FI JP NO) E(AT CH DE FR GB LU NL SE)

Insertion of foreign DNA I into a eucaryotic cell involves cotransforming the cell with the foreign DNA I to which an inducible promoter DNA III has been linked and with unlinked foreign DNA II that codes for a selectable phenotype not expressed by the cell. The cotransformation is carried out in a suitable medium, with selective conditions permitting survival or identification of eucaryotic cells that have acquired the selectable phenotype.

Prodn. of proteinaceous material involves cotransforming a eucaryotic cell with foreign DNA I coding for the material to which an inducible promoter DNA III sequence has been linked as described above, then maintaining the cotransformed cell under suitable conditions, including presence of an agent capable of inducing the promoter DNA III so that DNA I can be repeatedly transcribed to form complementary mRNAs; which are translated to produce the proteinaceous material and this is recovered.

By using the techniques, eucaryotic cells can be produced for use in the prodn. of proteinaceous materials such as interferon, insulin, growth hormone, clotting factor, viral antigen or antibody or enzyme etc. By using other claimed procedures genetically defective erythrocyte cells associated with sickle cell anaemia can be treated, foreign DNA I coding for normal globulin and DNA II coding for drug resistance being used. (104pp)

AXEL/★ D16 69828 D/38 ★WP 8102-426
Insertion of DNA into eucaryotic cells by co:transformation etc. - useful in enhanced prodn. of proteinaceous materials

Aerobic fermentation of bile - for selective microbial degradation to steroidal and seco-steroidal prods.

COMMONWEALTH SCIENT ORG(PARK/) 22.02.80-AU-002498

B01 (B05) (03.09.81) C07c-49/74 C07j-01 C12j-09 C12j-13 C12p-07/38 C12p-33

13.02.81 as AU0017 (1248NS) (E) AU7945981 US3023229 US2960513 US4101378 FR2408621 EP--14991 EP--8214 8.Jnl.Ref N(AU JP US) E(DE FR GB NL)

Fermentation of bile includes the step of cultivating an aerobic micro-organism that can selectively degrade bile acids or their conjugates in bile, in a nutrient medium under aerobic conditions. From the medium a steroid of formula (I) of a secosteroid of formula (II) is isolatable. In the formulae, X and X' are H, OH or oxo; the broken bonds are optional double bonds; and R is oxo, OH or CHMe-COOH.

Cpds. (I) and (II) are produced economically and at a fast rate, so that contamination with other prods. is minimised. The prods. (I) and (II) are intermediates in the prepn. of therapeutic agents.

The micro-organism is pref. a Rhodococcus, Pseudomonas or Nocardia strain, esp. strains ATCC 31754 or 31753. Cattle or sheep bile is pref. used. Cultivation is at 25-30 deg. C. The prods. are recovered by centrifuging, then the liquor is acidified and extrd. with water-immiscible organic solvent. The crude prod. is purified by recrystn. or chromatographically. In a pref. procedure the liquor left after centrifugation is percolated through a column of porous polymer beads, then the column is washed, and eluted with mixts. of water, MeOH and water-immiscible solvent, and the prods. are subsequently crystallised. (24pp)

 US1677406 N(AU BR JP SU US)

Process is claimed for continuous hydrolysis of pentosan-contg.
 hemicelluloses, cellulose and similar cpds. in vegetable
 biomaterial into sugars. The comminuted raw material is treated
 in a first stage in the presence of dil. acid under conditions of
 temp. and press. such that the hemicelluloses and only partly the
 cellulose are hydrolysed during a first period to pentoses and
 partially hexoses. The reaction mixt. is then suddenly released
 and the hydrolysate is sepd. from the biomaterial. The cellulose
 in the biomaterial is then hydrolysed to hexoses in a second stage
 with dil. mineral acid under more rigorous conditions of temp.
 and press., after which the press. is again suddenly released and
 the residual biomaterial is sepd. from the hydrolysate.

The biomaterial is fed into the pressure reaction chambers by
 means of a screw feed which acts as a pressure seal and in which
 air and excess moisture in the biomaterial are largely removed.
 Hydrolysis is carried out in a continuous horizontal cooker in the
 vapour phase. The neutralised hydrolysate is recovered in
 several sepn. stages and further processed to recover the sugars.

Process can be used with a wide range of cellulosic raw
 materials, including voluminous materials such as annula plant
 residues, waste paper etc., which cannot be used in percolation
 type cookers. The sugars obtd. can be fermented to form
 alcohols, which are useful as a fuel additive. (44pp)

 A method for denitrating aq tobacco extracts comprises
 circulating an acidic tobacco extract having a solids content of
 about 5-50% and a resistivity of about 8-50 ohm-cm through the
 alternate cells of an electrodialysis unit having an anion
 permeable membrane toward the anode spaced no more than
 about 0.04 inches from an anion impermeable membrane toward
 the cathode.

The membranes have a tightness sufficient to minimise
 transfer of nonelectrolyte substances. Brine is circulated
 through the remaining cells and about 0.5 to 2.0 volts/cell pair is
 applied to the unit. (4pp)

Selective denitration of aq. tobacco extract - without removing potassium, to reduce amt. of nitrogen oxide etc. formed during smoking

PHILIP MORRIS INC 05.03.80-US-127386

P15 (09.09.81) A24b-15/24

04.03.81 as 101525 (1251NS) (E) US4131117 US4131118 US3847164 US3616801 E(BE CH DE FR GB IT LI)

Tobacco is treated by first extracting with an aq. soln., then subjecting the extract (A) to selective removal of nitrate ions, without reducing the potassium ion content, by an ion-extraction technique. The treated extract is then recombined with the insoluble tobacco residue (B) remaining after extraction. Pref. ion-removal is by membrane electrodialysis (using a unit contg. alternating bipolar and anion-permeable membranes); electroregenerating ion-exchange; ion-exchange resins or by Donnan dialysis. Extraction is pref. with a denitrated extract contg. tobacco solubles, and pref. metal ions are neutralised before recombining with (B). Extraction is pref. at aq. soln.: tobacco wt. ratio 5-100:1 at 60-95 deg.C.

The treatment reduces the amt. of gaseous components (HCN, CO and partic. nitrogen oxides, esp. NO), formed when the tobacco is smoked. By removing nitrate but not potassium, a greater redn. in N oxides prodn. is achieved compared to removal of both ions simultaneously. (40pp)

25.02.81 as 300786 (1251KB) (E) No-Citns. E(AT BE CH DE FR GB IT LI NL SE)

Aq. compsn. for darkening keratinous material comprises a mixt. of (a) thiosulphuric acid salt; (b) a Bi complex of an aminopolyacetic acid; (c) a water-soluble amine and (d) a di- or poly-hydroxy humectant. Pref. it contains (wt.%) 0.2-5(1-3)% thiosulphate ion; 0.1-5(0.1-1.5)% bismuth (as carbonate); enough (c) to maintain pH 8-11, and 5-70% (d), esp. 20-70% propylene glycol or 5-30% glycerol. Specifically (c) is mono-, di- or tri-ethanolamine; the complexing agent in (b) is esp. EDTA, and (a) is a soln. of an amine, Na, K or ammonium thiosulphate.

The compsn. is esp. applied to human hair, but can also be used on wool and fur. The solns. are stable and the thiosulphate greatly enhances the darkening effect of (b). (14pp)

CARS-★ D21 68352 D/38 ★FR 2475-393
Hair setting process using compsn. contg. guanidine hydroxide - prepd. from guanidine salt and ion exchange resin hydroxide

CARSON PRODCO 11.02.80-US-120091 (08.02.80-US-119836)
E19 (14.08.81) A61k-07/11

05.02.81 as 002233 (597BZ)

The process comprises contacting the hair in the desired

arrangement with an aq. compsn. contg. a prod. prepd. by mixing in aq. medium more than 0.25 mole of at least one soluble guanidine salt and an effective amt. of at least one ion exchange resin in particle and quaternary ammonium hydroxide form. The resin is chosen to have an affinity for the guanidine salt anion which is at least equal to the affinity of the resin for the hydroxide ion. After a sufficient contact, the compsn. is removed. In another embodiment the compsn. comprises guanidine hydroxide prepd. as above with at least 1 min. reaction followed by sepn. of the ion exchange resin from the soln. A compsn. for the above comprises guanidine hydroxide and at least one quaternary ammonium ion exchange resin to which is linked, at least in stoichiometric amt. based on the hydroxide, an anion as above.

The process is used to frizz, relax or permanent wave the hair. The process enables in situ prepn. of guanidine hydroxide which is relatively unstable forming the carbonate in air; it also avoids disagreeable odours. (31pp)

HUBE D21 67037 A/38 = GB 1598-233
Abrasive silica compsn. for dentifrice paste - contains amorphous silica pptd. by acidulation of a soln. of alkaline earth metal silicate in soft water

HUBER J M CORP 20.12.77-US-862384
E33 (16.09.81) *BE-864-872 A61k-07/18 C01b-33/19

14.03.78 as 009954 (924LB)

Abrasive compsn. comprises a pptd. amorphous SiO₂ prepd. from a soln. consisting of water and an alkali metal silicate by acidulation. The SiO₂ is reacted with a salt oxide or hydroxide of an alkaline earth metal such that the salt is present in an amt. of 10-300 ppm of alkaline earth metal.

The SiO₂ obtd. exhibits a radioactive Dentin Abrasion value of at least 40, a pack density of 0.24-0.55 g/ml, an oil absorption of 70-95 ccs/100g, a BET surface area of 100-250 sq.m/g, 1% loss on ignition of 4-6% and an ave. particle size of 5-15 microns. The abrasive has a fluoride compatibility of at least 90%. Pref. alkaline earth metal is Ca, Sr or Mg.

The dentifrice abrasive is esp. suitable for therapeutic toothpaste compsns. contg. both soluble fluoride salts and soluble phosphate salts. (20pp)

LIOY★ D21 68663 D/38 ★J5 6095-937
Non-aq. pasty compsn. - prepd. from hydroxyethyl cellulose and glycol; used for dentifrice

LION DENTIFRICE KK 28.12.79-JP-172340
A96 B05 (A11 B07) (03.08.81) C08I-01/28

28.12.79 as 172340 (136BZ)

Non-aq. pasty compsn. prepd. by dissolving (1) hydroxyethyl cellulose having an ethylene oxide-addition mole number of above 2.8 in (3) one or more polyvalent alcohols selected from glycerine, ethylene glycol, diethylene glycol and propylene glycol. The upper limit of the ethylene oxide-addition mole number of (1) is about 5. The amt. of (1) used is 0.8-10 wt.% of compsn.

According to the application of the pasty compsn., other hydrophilic and lipophilic components may be added to the compsn. including abrasive (e.g. calcium carbonate, anhydrous silicic acid for tooth paste), activator (e.g. sodium laurylsulfate), sweetening agent.

(1) is dissolved in (2) which is non-aq. at room temp. and tackifys (2). Then, the mfg. process is simplified. The pasty compsn. is used for mfr. of tooth paste, ointment, a medicine for external use. (5pp)

LIOY★ D21 68696 D/38 ★J5 6095-993
Creamy detergent compsn. - comprising alpha-olefin sulphonic acid anionic detergent, polyoxyalkylene cpd. and an ester

LION CORP 21.11.79-JP-151409
A96 E17 (03.08.81) C11d-01/14 C11d-03/20

21.11.79 as 151409 (126KB)

Compsn. contains (a) 20-40wt.% anionic surfactant consisting of a salt of alpha-olefin sulphonic acid, (b) 3-20wt.% polyoxyalkylene cpd. of formula: RO(CH₂X.CH₂O)_nH (I) (where X is H or CH₃; n is an integer of 1-20; R is 12-22C linear satd. alkyl), and (c) 2-10wt.% ester which is solid at ordinary temp. Detergent compsn. has a viscosity varied by the change of the temp.

(a) consists of at least 50(80-100)wt.% alpha-olefin sulphonic acid salt and less than 50(0-20)wt.% anionic surfactant other than (a). The content of the anionic surfactant in the detergent is 20-40(25-35)wt.%. Specifically it is a water-soluble Na, K or Mg salt of an organic sulphonic acid obtd. by the sulphonation of 13-18 C linear alpha-olefin. The sulphonated prod. is then hydrolysed. (7pp)

28.12.79 as 173440 (128DJ)

A shampoo compsn. is obtd. by adding (a) 0.1-2.5wt.% anionic phosphoric ester type surfactant based on the amt. of the shampoo compsn. of formula

A-M-O-P(O)(OX)(OB) (I)

(where A is 8-18C (unsatd.) hydrocarbon residue or an aliphatic monoamide residue; M is a residue of formula $-(CH_2-CHR-O)-m$ (where R is H or CH_3 gp.; m is 0-8; each oxyalkylene residue can be same or different to each other); B is a residue of formula A-M-and/or X, or where X is H, alkali metal, or (hydroxy)alkyl subst. ammonium, and (b) 0.05-2.5wt.% cationic polymer based on the amt. of shampoo compsn.

The base material is pref. selected from a 10-14C alkyl sulphate, 8-20C alkyl ethoxysulphate added to 0.5-8 moles in ethylene oxide, an aliphatic mono- or di-ethanolamide, amphoteric surfactant such as alkylamine oxides, alkyl betaines, or 10-14C imidazoline cpds. The cationic polymer is pref. selected from (i) copolymers of quaternised vinyl pyrrolidone with ethyl methacrylate, (ii) copolymers of adipic acid with dimethylaminohydroxy propylenediamine, (iii) poly(N,N-dimethyl-3,5-methylene piperidinium chloride), (iv) copolymers of N,N-dimethyl-3,5-methylene piperidinium chloride with acrylamide, (v) copolymers of acrylamide with beta-methalloxyloxy trimethyl ammonium, (vi) quaternised guar gum, (vii) polyethyleneimine, (viii) cationised cellulose, and (ix) condensates of polyamine with polyglycol.

Shampoo compsn. facilitates brushing and prevents generation of static electricity. Split ends are prevented. (7pp)

INOZ ★ D21 68708 D/38 ★ J5 6096-039
Silver-tin based dental amalgam - contains rare earth metal and has good corrosion and wear resistance

INOUE JAPAX RES INC 29.12.79-JP-172972

M26 (03.08.81) A61k-06/04 C22c-05/06

29.12.79 as 172972 (53DH)

Ag-Sn based dental amalgam includes a rare earth metal in an amt. 1-10 pref. 1-7.3%. This improves a conventional Ag-Sn dental amalgam to be excellent in oral corrosion resistance, wear resistance and durability, by adding the rare earth metal. The rare earth metal e.g. La is of high surface activity.

The surface of the alloy mixed with the mercury is formed with a corrosion resistant film to promote the amalgamation, while the La remaining unreacted inside of the alloy activated the amalgamation further to form rapidly a hardened layer for increasing strength and corrosion resistance of the alloy and imparting a suitable swelling performance to the amalgam. Mixing ratio of the mercury to the alloy may be reduced to 1:1, with rapid mixing and hardening. (3pp)

EART- ★ D21 68868 D/38 ★ J5 6097-205
Insect repellent effective against e.g. ants and slugs - contains e.g. 2-phenoxyethylthiocyanate

EARTH SEIYAKU KK 29.12.79-JP-173599

B05 C03 E14 (D22) (05.08.81) A01n-47/48

29.12.79 as 173599 (108AT)

Insect repellent contains a cpd. of formula (I), where n is 2-7.

Examples of (I) are 2-phenoxyethylthiocyanate, 3-phenoxypropylthiocyanate, 4-phenoxybutylthiocyanate, 4-phenoxybutylthiocyanate, 6-phenoxyhexylthiocyanate, etc. While the active cpd. can be used directly, it is pref. used with a carrier. The liquid formulation can opt. contain film-forming agent, stabiliser, emulsifying agent, dispersing agent, spreader, wetting agent and propellant, and is used in the form of paint, adhesive, emulsion, dispersion, lotion, cream, aerosol etc. It is possible to use the active cpd. in combination with other repellent, effect-reinforcing agent, insecticides, antioxidants, fungicides, herbicides and fertilisers.

(I) repels harmful insects such as hygienically harmful insects, cereal harming insects, cloth harming insects, ants and slugs. It is possible to prevent contact with harmful insects and invasion of harmful insects, by applying (I) in kitchen, dining room etc. (9pp)

NIKK- ★ D21 68870 D/38 ★ J5 6097-208
Stable cosmetic cream having excellent texture - contains basic amino acid, higher fatty acid and polyhydric alcohol

NII KK 29.12.79-JP-171527

E17 (05.08.81) A61k-07

29.12.79 as 171527 (5RP)

The cosmetic contains basic amino acid, higher fatty acid and polyhydric alcohol.

The cosmetic cream can be prepd., e.g. by (a) mixing higher fatty acid in oily base such as bees wax, fluid paraffin, higher alcohol, etc., (b) heat-dissolving the mixture at ca. 80 deg.C, (c) dissolving polyhydric alcohol and basic amino acid in refined water at ca. 80 deg.C, (d) mixing thus obtd. oily phase and aq. phase with stirring for reacting basic amino acid and higher fatty acid, (e) cooling the mixt. and (f) combining perfume, antiseptic, etc. in thus obtd. cream. Polyhydric alcohol serves to promote the reaction and to stabilise the reaction prod. and usually it is used 5-40 w/w% based on cosmetic.

The salt formed from basic amino acid and higher fatty acid serves as the emulsifier and by combining polyhydric alcohol the stability of the emulsifier can be improved. The stable cosmetic gives low stimulation to skin and has excellent texture. Further the reaction between basic amino acid and higher fatty acid can be completed at ca. 80 deg.C in a short time and the cosmetic base is not deteriorated during the reaction. (3pp)

SHIS ★ D21 68871 D/38 ★ J5 6097-210
Cosmetic remover - comprising mono- and/or di-ester(s) of 23-28 C, do not cause skin or eye stimulation

SHISEIDO KK 28.12.79-JP-172896

E17 (05.08.81) A61k-07/02

28.12.79 as 172896 (5RH)

Cosmetic make-up remover contains 30-100 wt.% of 23-28C monoesters and/or 23-28C diesters.

Remover effectively removes make-up without causing stimulus to skin and to eye mucous membrane.

Pref. (di)esters having 23-28C (esp. 24-26C) are used and their constituents are selected from fatty acid, dibasic acid, alcohol and glycol. Though their constituents can be used regardless of the fact that they are saturated or unsaturated and linear or branched, practically (a) the monoester of satd. fatty acid and satd. aliphatic alcohol, (b) the diester of satd. dibasic acid and satd. aliphatic alcohol and (c) the diester of satd. fatty acid and satd. aliphatic glycol can be used. Examples are decyl myristate, 2-ethylhexyl palmitate, oleyl caprate, cetyl 2-ethylhexanate, ethyleneglycol dilaurate, neopentylglycol didecanoate, etc. (5pp)

HOHY- ★ D21 68872 D/38 ★ J5 6097-214
Hair colourant - prepd. by negatively charging granular colourant, used for electrostatically coating onto hair

HOHYU KK 07.01.80-JP-000375

(05.08.81) A61k-07/13

07.01.80 as 000375 (5RH)

Hair colourant is prepd. by charging the granular colouring substance which has granular size 0.1-10 microns and is non-toxic or only slightly toxic to man, electrically negatively and packaging it in an appts., from which the substance can be injected toward head. As the equipment electrostatic painting equipments including isoelectric-type, constant voltage-type and constant current-type, can be used and among them constant current-type electrostatic painting equipment having the hand gun controlled with non-needle electrode as spraying nozzle, can be used favourably.

Hair and colouring substance are electrically attracted and the colouring substance is uniformly adhered to hair without forming spots. Thus hair can be coloured beautifully with saving colouring substance.

Carbon-black, azo-type pigment, vat-type pigment, tar-type pigment, etc., of which use is permitted can be used and the pigment is used together with resin-type setting agent, perfume, etc. The electrostatic painting appts. can be also used for hair spraying by using hair spraying agent instead of colouring substance. (5pp)

Filter to purify cadaveric exhaust gas from metal coffin - has reverse flow by/pass to prevent implosion during air transport

BIZETA 03.06.80-FR-012695

P33 (14.08.81) A61g-17 B01d-53

08.06.80 as 012695 (448HM)

Filter to purify cadaveric gases exhausted from a coffin to avoid excessive internal pressure build-up and danger of explosion. This filter is partic. suitable for metal coffins used for the transport by air of cadavers, i.e. when an excess internal pressure may be experienced due to a sudden loss of altitude.

The filter is now provided with a non-return, reverse flow bypass so that a sharp rise in external pressure will occasion an immediate inflow of air to equalise internal and external pressures. There is now no danger of an implosion in these circumstances.

The non-return valve is pref. an elastic sleeve over a perforated exhaust pipe. (7pp)

Filter to purify cadaveric gases from metal coffin - has two bell float chambers in series to bubble gas through liq. reagents

BIZETA 20.05.80-FR-011636 (08.05.79-FR-012134)

P33 (14.08.81) A61g-17 B01d-53/14

20.05.80 as 011636 Add to 8.3.79-012134 (448HM)

Parent patent was for a filter for the purificn. of cadaveric gases released from a metal coffin to avoid excessive internal pressure build-up. The filter comprises two filter chambers in series, the first contg. a liq. through which the gases are bubbled into a bell float. Gases are discharged from the bell float into the second chamber which contains a dry filter element.

The second chamber is now equipped with liq. and a bell float instead of a dry filter element, which is more expensive if to be equally effective. Pref. the two chambers contain different treatment reagents.

The exhaust from the second chamber is fitted with a droplet trap. (5pp)

Disposable article for absorbing bodily excretions - contg. saline water indicating material

TOWNSEND M S 30.11.79-US-098914 (20.09.78-US-943960)

A96 E24 S03 P32 (01.09.81) A61f-13 G01n-33/52

30.11.79 as 098914 (513AT)

Disposable article for absorbing bodily excretions comprises (a) a quantity of absorbent material for absorbing bodily excretions; (b) a semitransparent water-impermeable backing sheet for retaining the absorbent material and absorbed excretions and (c) a quantity of non-leachable saline water indicating material placed in contact with the absorbent material and in close proximity to the semitransparent backing sheet, to indicate the presence of absorbed secretions.

The saline water indicating material is pref. comprised of a water-insoluble polymeric ion exchanger in intimate contact with a water-insoluble polymeric exchanged-ion indicator. The water-insoluble ion exchanger is pref. a hydrogen ion loaded cation exchanger and the exchanged ion indicator is pref. a cellulose-bound acid-base indicator obtd. by reacting cellulose with a reactive dye such as 4-anilino-3'-(2-hydroxysulphonyloxy-ethylsulphonyl)-azobenzene-6'-carboxylic acid (I).

The prods. may be made in the form of bandages, diapers, sanitary napkins, etc. which give a visible colour change in contact with urine, perspiration, feces and other saline body excretions. The indicators are non-leachable and therefore do not come into contact with the skin, and the colour change is visible through the semitransparent backing. (13pp)

Solvent fractionation of olive oil stearin - prods. useful as confectionery fat, cosmetic and pharmaceutical base, and sources of fatty acids and squalene

BIOCELL SPA 28.02.80-IT-020225

B07 (D13 D21) (09.09.81) C11b-07

16.02.81 as 200180 (1251BZ) (E) FR2427386 GB-750045 US3431116 E(BE DE FR GB NL)

Solvent fractionation process for olive oil stearin (A) comprises dissolving up (A) in a mixt. of 'hydrocarbon' solvents (I) of b.pt. below 130 deg.C, at (A): solvent ratio 5:1, then cooling and crystallising at 15 deg.C. This gives a ppte. enriched in satd. C16 fatty acid and a filtrate enriched in mono- and di-unsatd. C18 acids. Alternatively, acetone is used at solvent ratio 7.5:1 with crystallisation at 25 deg.C, and the filtrate is further resolved at solvent ratio 3:1 and crystallisation temp. 2 deg.C to give a second ppte. and a filtrate.

Also new are the fractions obtd.: (a) glyceride fraction of m.pt. 60-70 deg.C; (b) semisolid fraction of m.pt. under 46 deg.C. and (c) an oil fraction with solidification point under 10 deg.C.

Fraction (b) is useful as a component of confectionery fat, esp. as a partial replacement for cocoa butter; fractions (a) and (b) are useful as cosmetic and pharmaceutical base materials. Hydrolysis of (a) produces palmitic and stearic acids; and of (b) or (c) oleic acid. Fractions (b) and (c) are also sources of squalene. (13pp)

Detergent compsns. for use in dish washing machines consist of a granulated mixt. of (A) a powdered or granulated component contg. quickly water-soluble or -dispersible ingredients of standard dish-washing machine compsns. and (B) a granulated component of finely-divided, water-insoluble inorganic cpds. having particle size between dust fineness and 100millimicrons, esp. below 10. The granulates have grain-size 0.2-4 (0.5-2)mm and wet grain stability having half-value 1/4 to 3 and end-value no higher than 15 wt.% of grains having size 0.4mm (as determined by a method given in description, comprising grain-size reduction measurements in an agitated aq. suspension at 60 deg.C after 15- and 30 min.).
The compsns. clean hard surfaces, esp. cooking pots and baking dishes, and combine the chemical activity of (A) with the mechanical activity of (B). (24pp)

HENK ★ D25 68257 D/38 ★EP --35-263
Tert. amino gp.-contg. polyester and salt derivs. - prepd. by esterifying alkoxyated tert. amine with di:carboxylic acid and use as textile softener
HENKEL KG AUF AKTIEN 01.03.80-DE-007930
A23 F06 (A97) (09.09.81) C08g-63/68 D06m-15/52
28.02.81 as 101463 (200BZ) (G) No-Citns. E(AT BE CH DE FR GB IT LI LU NL SE)
New tert. amino gp.-contg. polyesters, (A), and their salts with lower carboxylic- and inorganic acids, are prepd. by reacting a dicarboxylic acid having formula
HOOC-R3-COOH (I)
(where R3 is an aliphatic, aromatic or alicyclic opt. substd. 1-10C gp.) with an alkoxyated tert. amine having formula
H(O-CHR1-CH2)m-NR-(CH2-CHR2-O)nH (II)
(where R is an opt. satd. linear or branched 1-20 (6-20) C aliphatic gp.; R1 and R2 are H or Me and are opt. identical; and m and n are nos. 1-20, provided that the sum of m and n is 2-30 and the degree of polymerisation of the polyester is 2-50 esp. 10-20).
(A) and their salts are used as textile softeners in detergent and textile rinsing compsns. The treated textiles retain their absorption capacity. (A) can be removed without trace from the washed textiles. (A) are liqs. and dissolve in water without forming gels. (29pp)

CIBA ★ D25 68330 D/38 ★EP --35-470
Water-soluble aluminium or zinc phthalocyanine deriv. - substd. with quaternary ammonium gp.-contg. sulphonamide and used as photo-activator in textile treatment compsn.
CIBA GEIGY AG 29.02.80-CH-001624
E12 F06 (09.09.81) C09b-47/04 C11d-03/39 D06l-03/04
23.02.81 as 810056 (200AT) (G) EP---3371 EP---3149 GB1372035 GB1408144 FR2384882 FR2329746 J54145712 BR---7900 2.Jnl.Ref E(AT BE CH DE FR GB IT LI LU NL SE)

Textile treatment compsns., for washing, rinsing and bleaching textiles, contain a cationic gp.-substd. water-soluble Al- or Zn phthalocyanine, as photo-bleaching agent, and cationic textile treatment agents, e.g. cationic tensides, softeners, antistatics, optical bleaching agents and/or anti-microbial components.

New phthalocyanine cpds. have formula
(PC)-(SO2X1-R1-X)vA-w (I)
or (II), (R3O)a-(PC)-(SO2X1-R1-X)v
where PC is the unsubstd. Zn- or Al phthalocyanine ring system; v is 1-4; R1 is opt. branched 1-8C alkylene or 1,8- or 1,4-phenylene. X1 is NH or N-alkyl. X is a gp. having formula -NR2R3R4, (III), (IV) or -COCH2-NR2R3R4. R2 and R3 are opt. substd. 1-6C alkyl; R4 is opt. substd. 1-6C alkyl, 3-7C cycloalkyl or NR6R7. R6 and R7 are H or opt. substd. alkyl. m is 1-6; A completes an aromatic 5- to 7-membered N-heterocycle, which opt. contains 1 or 2 more N atoms as ring-members and opt. carries different substituents. B completes a satd. 5- to 7-membered N heterocycle, opt. contg. another 1-2 N-, O- and/or S atoms as ring-members and opt. carrying further substituents. A- is an (in)organic anion; w equals v in case of monovalent anions A- and is no higher than v in the case of polyvalent anions, and A-w must compensate the positive charge. The phthalocyanine ring system can contain further water-solubilising gps., e.g. sulpo gps., and all substituents are bonded to the Ph ring of the phthalocyanine ring system.

In (II), R3O is a non-ionic substituent, esp. F, Cl, Br, I or CN; a is 0.1-4.

The photo-bleaching effect of the photo-bleaching agent is unaffected by the cationic textile treatment compsn. and vice-versa. The photo-bleaching agent facilitates stain removal from fabrics and prevents dye transfer between individual fabrics. (73pp)

EKAA- ★ D25 68335 D/38 ★EP --35-478
Anti-redeposition agent for preventing greying of polyester - is multifunctional ester contg. free hydroxy and free carboxy gps.

EKA AB 05.03.80-SE-001698
E19 (09.09.81) C07c-67/08 C07c-69/07 C11d-01/72
12.01.81 as 850004 (1251HM) (E) DE2846984 GB1563808 FR2348964 GB1575007 DE2717300 FR2348963 US4138352 GB1505798 DE2301728 DE2834073 E(AT BE CH DE FR GB IT LI NL SE)
Antiredeposition agent is an ester (I) formed from one or more (cyclo)aliphatic or aromatic di-, tri- or tetra-valent carboxylic acid (II) and one or more (cyclo)aliphatic di-, tri- or tetra-valent alcohols (III). (I) contains 1-6(1-3) esterified acid units, and the ratio of free hydroxy gps. to free carboxy gps. is 2-30(5-15). Esp. (I) has 1-3(2-3) free hydroxy and 0.1-0.5(0.2-0.4) free carboxy per mole. (II) is esp. phthalic anhydride, isophthalic, adipic, maleic and trimellitic acids, and (III) is esp. (di)ethylene glycol or 1,2-propanediol.

(I) is pref. incorporated into detergents at 0.1-2%, e.g. by adding to the slurry before spray-drying; spraying, as a melt or soln., onto the dry detergent; or by adsorption onto a carrier.

(I) are added to detergents to prevent greying. They are as effective on polyester as carboxymethylcellulose is on cotton. (12pp)

AIRW- ★ D25 68341 D/38 ★FR 2401-988
Carpet cleaning and treating powder compsn. - contg. adsorbent powder and per:chloroethylene opt. with ether alcohol

AIRWICK AG 01.09.78-FR-025314 (02.09.77-US-830238)
E16 (04.04.79) C11d-17/06
01.09.78 as 025314 (597HM)
Compsn. comprises 40-85% of an adsorbent powder and 15-60% of a solvent selected from parchlorethylene and 3-10:1 perchlorethylene/ether-alcohol mixts. the latter opt. also mixed with water. Carpets are cleaned and giving an antistatic and anti-staining treatment by spreading 10-15 gm/sq.m of powder on the carpet using a wet cloth. After a few minutes contact the powder is removed by suction or brushing.

Pref. ether-alcohols are glycol mono methyl, ethyl and butyl others; propylene and diprpylene glycol monomethyl ethers, and diethyleneglycol mono methyl and ethyl ethers. Pref. amts. of water are less than 5% and 5-10%. The method is simple and effective, not requiring any special appts. It is also quick and avoids the disadvantages of wetting the carpet. (17pp)

ROUC/ ★ D25 68368 D/38 ★FR 2475-518
Oxidising prod. contg. sodium peroxide used for bleaching etc. - stabilised with sodium para-hydroxybenzoate and carbonate

ROUCHOUSE G 12.02.80-FR-003330
E12 H01 Q31 (E34) (14.08.81) B65b-01 C01b-13/08 C07c-65/03 C11d-03/10
12.02.80 as 003330 (597AS)
The prod. may be used e.g. as bleaching agent in washing prods.

by adjusting the aq. hypochlorite soln. to pH 12-13.5, then adding a premix of (I) and RABNO (R is straight chain alkyl with more than 55% as 11-13C; AB are Me, or NAB is morpholine).

Inexpensive (I) impart a woody, piney, herbaceous aroma to stable aq. hypochlorite solns. (17pp)

LIOY D25 34645 D/20 = US 4287-101
Enzyme-contg. detergent compsn. for textile washing - contg. olefin sulphonate(s), anionic surfactant(s) and pyrophosphate(s) in specified ratio

LION FAT & OIL KK 29.10.79-JP-139478
(01.09.81) *DE3012-145 C11d-03/06

27.03.80 as 134453 (924MR)

Enzyme-contg. detergent compsn. comprises (I)(a) at least one 10-20C alpha-olefin sulphonate, (b) at least one anionic surfactant having SO₃ or SO₄ gp. other than the olefin sulphonate, and (c) at least one Na or K pyrophosphate and (II) at least one enzyme selected from proteases, amylases and lipases.

The total amt. of components (a), (b) and (c) is at least 25 wt.% based on total wt. of compsn. The wt. ratio of (a):(b):(c) is within the area enclosed by the points A(a:b:c = 80:0:20), B(a:b:c = 35:40:25), C(a:b:c = 20:40:40) and D(a:b:c = 50:0:45) defined in a triangular diagram. Pref. the enzyme is at least one proteolytic enzyme derived from bacteria. Pref. the compsn. has an enzyme activity of 1-40 Anson units/1 kg. of compsn.

The compsn. has good detergency esp. against soiled spots in fabrics or cloths, derived from a combination of sebum, sweat and fine dust. (7pp)

LIOY D25 30999 D/18 = US 4287-102
Cleaning compsn. contg. olefin sulphonate salt and amine oxide - at specific wt. ratio, useful as shampoo etc.

LION FAT & OIL KK 11.10.79-JP-131198

E19 (01.09.81) *DE3011-017 C11d-01/14

19.03.80 as 131636 (974HM)

Novel detergent compsns. comprise at least one water-soluble salt of a 12-16C olefin sulphonic acid (I) and at least one tert. amine oxide (II). (II) is of formula NR₁R₂R₃O, where R₁ is 10-14C alkyl and R₂ and R₃ are each 1-3C alkyl or hydroxyalkyl.

(I) and (II) are each at 2-20 wt.% of the concn. and are at a mol. ratio of 1.5-0.5:1 resp. The compsns. give a pH of 7.3-8.0 in 0.2 wt.% aq. soln. Pref. at least 50 wt.% of (I) is a salt of a 14C acid. Pref. at least 90 wt.% of (II) is a tert. amine oxide having a 12C alkyl gp. Pref. (I) and (II) total 6-30 wt.% of the compsn.

Compsns. are suitable for washing vegetables, dishes and human hair. (5pp)

Arrangement of Abstracts

'MAJOR' COUNTRIES – An alerting abstract of every basic document is provided, and of examined equivalents from West Germany, Great Britain, Japan, the Netherlands and the United States, and granted and unexamined European and unexamined PCT equivalents. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

D1: FOOD; FERMENTATION

D11: BAKING

WERN ★ D11 69875 D/39 ★ BE -888-805
Bakery oven using reversible flow heating air - which is always directed diagonally upwards through prod. to be baked
WERNER & PFLEIDERER 29.05.80-DE-020374
(28.08.81) A21b

14.05.81 as 888805 (448KB)

A bakery oven has a baking chamber with flat, vertical walls. An air heater and a fan are installed on top of the oven to circulate hot air through the baking chamber. Two opposed walls of the chamber are perforated so that hot air can be blown through one and extracted through the other. To this end an air duct covers the exterior of each of the walls, one duct connected to the delivery outlet of the fan heater and the other to the suction inlet. These connections are periodically reversed so that air flow through the chamber changes direction.

Whichever one of the ducts is connected to the delivery outlet is supplied with air only at the bottom of the duct. The other duct is connected to the suction inlet of the fan heater only at the top of duct. These conditions remain satisfied when airflow direction is reversed, so hot air always rises diagonally between the two walls. (21pp)

STAU ★ D11 69885 D/39 ★ CA 1106-224
Protein fortified doughnut compsn. - contg. whey protein concentrate to increase specific volume and fat absorption
STAUFFER CHEMICAL CO 18.11.77-US-853000
(04.08.81) A21d-13/08

30.10.78 as 314958 (955PW)

A protein fortified cake doughnut formulation contains (a) a cake doughnut base; (b) an effective amt. of at least one proteinaceous additive, and (c) an effective amt. of a whey protein concentrate to increase the specific volume and fat absorption of the doughnut prod. compared to a similar prod. not contg. (c).

Addn. of the whey protein offsets the depressing effect of the protein additive on specific volume and fat absorption. (14pp)

HIRT/ ★ D11 69911 D/39 ★ DD -149-153
Cracker cutting machine - with cruciform rotatable magazine feeding circular saws

HIRTE 22.02.80-DD-219205

(01.07.81) A21c-15/04

22.02.80 as 219205 (39PW)

An automatic portioning and dividing machine for strips of crackers, as they leave the baking oven consists of a cruciform magazine in which the strips are stored. When one springloaded arm of the magazine is full, it is turned through 90 deg. to place an empty arm under the charging conveyor and place the full arm facing a shaft with circular saws.

These perform the saw cuts into squares and the cut crackers are discharged on a conveyor to the packing machine. This reduces the labour requirement and the floor space by fully mechanised operation. (8pp)

SIDO/ ★ D11 70255 D/39 ★ EP --35-978
Gluten free baked goods prodn. - using potato flour and opt. other starchy material instead of cereals

SIDOTIF 07.03.80-IT-048101

(16.09.81) A21d-02/18 A21d-13/06

06.03.81 as 830035 (1251BZ) (E) No-Citns. E(AT BE CH DE FR GB LI LU NL SE)

Baked goods are made by first dry mixing potato flour and sucrose, then adding whole cows milk, and very slowly heating the resulting soln.-suspension, while mixing, until it thickens. The thickened mixt. is cooled, then poured, together with edible animal fat and opt. salt, into one portion of an amylaceous or starchy flour (A), completely free of wheat, barley, oats, or rye gluten. The compsn. is mixed and then yeast diluted with water gradually mixed into the dough, and a second portion of (A) also gradually mixed in. The resulting dough is then finished by conventional shaping, leavening, extruding, cooking, etc.

The process is used to make bread, bread sticks, rusks, etc. which are gluten-free so can be consumed by persons with coeliac disease or nephrosis. Despite the absence of gluten doughs which are easy to mix and which leaven well are obtd. (8pp)

BONG/ ★ D11 70262 D/39 ★ FR 2475-85
Bakery which simultaneously bakes loaves and special prods. using two different ovens and common proving chamber

BONGARD P 19.02.80-FR-003881

(21.08.81) A21b-01 A21c-13

19.02.80 as 003881 (448DH)

One of the ovens is for baking a large output of mass-produced loaves or patisserie prods. while the second oven simultaneously bakes prods. of a more individual nature. The proving chamber is available for processing the prods. for either oven or both. One of the ovens is now of the type which receives a trolley, the other oven has a fixed hearth plate. The ovens are both equipped with heat exchangers and a vapour generator supplies vapour to both ovens and as required to the proving chamber.

A system is from the ovens and from the proving chamber as necessary. The ovens and proving chamber are pref. assembled as a transportable, packaged unit on a common supporting frame. The three elements are pref. enclosed in a common layer of thermal insulation inside a single outer casing. A single, vapour extraction hood is pref. fitted on top of the assembly to all three elements. A compact, packaged unit is achieved. Heat consumption is reduced to a minimum by wrapping the combined elements in a common, insulating jacket. (9pp Dwg.No.1)

AKER D11 84405 A/47 = GB 1598-947
Aluminium foil lined baking tin - with flange extensions and cut-outs preventing corner unfolding

AKERLUND & RAUSING A/B 09.05.77-SE-005341

Q32 + Q34 (23.09.81) *DE2819-708 B65d-05/24 + B65d-81/34

09.05.78 as 018412 (006AS)

A tray-like container has one or both pairs of adjacent side walls connected by folded gusset panels, both the walls and the panels having outwardly-projecting edge flanges forming the container rim.

The side walls against which the gusset panels are folded have tabs on their edge flanges, which lie below and support the edge flange of an adjacent wall. Pref. the container is lined with Al foil, as a baking tray. The tabs seal the corners of the flanged rim. (7pp)

KANF ★ D11 71025 D/39 ★ J8 1036-897
Mfg. fat compsn. for icing - by mixing hydrogenated fat, other fats, ester of polyhydric alcohol of fatty acid and sugar and cooling (J5 25.4.75)

KANEGAFUCHI CHEM KK 21.08.73-JP-094197

(27.08.81) A23l-01/19

21.08.73 as 094197 (22KB)

Laurine type hydrogenated fat having m.pt. of 30 deg.C. or higher, other fat, partial ester of polyhydric alcohol of fatty acid, and sugar are mixed with agitation to give emulsion, followed by cooling rapidly. (J50046868) (4pp)

HANS/ ★ D11 71503 D/39 ★ US 4287-801
Perforating english muffins to permit opening - by sets of knives mounted on convergent chain conveyors sandwiching muffins

HANSON DR 04.02.80-US-118509

P62 (08.09.81) B26d-03/30

04.02.80 as 118509 (295BZ)

Muffins are perforated about their equator by contact with at least one and pref. two sets of chain conveyors carrying

projecting knives. The muffins are advanced by a conveyor belt which carries them between the two sets of knives which are arranged to sandwich the muffin. Pref. one set of knives has a linear speed greater than the conveyor belt, and the other a lower speed so that the muffins are rotated during the perforation. Each of the knife conveyor runs is supported by a subframe which can be oscillated laterally during the perforation. The subframes are oscillated out of phase by a single motor with two crank arms.

The appts. makes perforations in an English muffin to enable the user to break it cleanly. The transverse oscillation prevents the muffins from sticking to the knives. (9pp Dwg.No.3)

GROF/ ★ D11 71655 D/39 ★ US 4288-463
Pretzels made from extruded dough strand - rotated about eccentric axis to yield spiral of preselected pitch
GROFFE I 19.02.80-US-122374 (08.06.78-US-913582)
(08.09.81) D21c-11/16
19.02.80 as 122374 (+ 25.01.79-US-006359) (295BZ)

Pretzels are mfd. by extruding the dough to form at least one strand. This is rotated during extrusion about an eccentric axis to wind it spirally. The dough is gravitationally passed downwards during the rotation onto a conveyor belt. The vertical distance between the point of extrusion and the belt is adjustable to change the wound spiral to a selected pitch. The wound strand is carried away by the belt for subsequent baking.

Pref. a plurality of dough strands are simultaneously extruded and are conveyed away on a single conveyor for baking.

The method is simple and is capable of rapid production of high quality pretzels. (7pp)

CIND- ★ D12 69846 D/39 ★ BE -887-844
Off/loading live chickens from cages in road transport vehicle - using powerful air current to drive them onto discharge conveyor
CINDAG SA 23.08.80-DE-031827
P14 (09.09.81) A01k A22b
09.03.81 as 887844 (448AT)
Method and installation for offloading live chickens etc. from transporter cages stacked side by side and one above another on the deck of transporting vehicle.

All cages have an exit door, on the same side of the vehicle. The door is opened to lead into a discharge corridor and a current of air is blown through the cage from the end opposite the exit. The air current drives the chickens from the cage into the discharge corridor. Pref. the air speed of the driving current is more than 100 km/h.

The cages are pref. left in situ in the vehicle while the birds are offloaded. The entry corridor can pref. be located by a powered mechanism to communicate with a gp. of cages to be discharged.

Cages remain in situ on the road transport vehicle, used for delivery of birds from a broiler house to an abattoir. Very rapid offloading, e.g. about 8000 birds per hr. is achieved without damaging the birds which do not have to be seized by hand or machine. There is no manhandling of cages which remain in situ on the lorry. (29pp)

WOLF/ ★ D12 69900 D/39 ★ CA 1106-737
Appts. for treating meat products prior to packaging - has rollers having blunt teeth to increase surface area of meat, improve colour and flexibility

WOLFF G G 18.09.78-US-943426
(11.08.81) A22c-09

14.09.79 as 335680 (1044NS)
Appts. includes a continuous foraminous conveyor with two pressure rollers having blunt teeth around their periphery disposed above the conveyor for macerating meat pieces transported along the conveyor. Spring loaded tension plates under the conveyor in corresponding posns. to the rollers apply pressure to the meat pieces passing under the rollers on the conveyor.

Appts. is used to treat cured hams. Cooking and smoking shrinkage is reduced and the use of gelatin is decreased. The distribution of cure, colour and tenderness is improved. The blunt teeth of the rollers enlarge the surface area of the meat pieces and cause an increase in the release of myosin which is the natural binder in meat. (9pp)

MASZ ★ D12 69912 D/39 ★ DD -149-154
De-fleshing machine for bones - with conical sleeve and conical water cooled screw

MASTER MECHANICS CO 20.02.79-PL-213567
(01.07.81) A22c-17/04

20.02.80 as 219162 (39DH)
Machine for use in the meat, fish, fruit and vegetable industries, to separate flesh from bones, consists of a conical sleeve with a conical screw. The screw is hollow and encloses a cooling tube which emerges through a cap at the end opposite to the charge end. A flexible hose joins the chamber, formed by the cap, with an annular chamber near the end of the screw and the discharge pipe.

This tears off the flesh adhering to bones and converts it to a liquid state, thus increasing the flesh yield. (9pp)

FARH D12 66505 B/37 = DS 2960-393
Sausage meat filling device - with calibrating tube and disc maintaining constant filling dia. by braking action

HOECHST AG 04.03.78-DE-809385

(17.09.81) *DE2809-385 A22c-11/02

26.02.79 as 960393 Based on EPG004013 (1438WB)

Appts. for filling a shirred tubular sleeve with a sausage compsn., which is fed under pressure from a stuffing machine filler tube, includes a calibration unit with a hollow calibration tube, a widened end section, and a calibrating element. The calibrating element contacts the inside surface of the widened section of the tube, and the end section next to the opening of the filler tube has a compact circumferential surface. The calibrating tube can move w.r.t. the filler, and the second member is fixed to the filler surface.

The appts. is efficient, and the tubular sleeve width can be controlled during the sausage filling process. (8pp)

HAUS/ D12 60954 C/35 = EP G014-685
Animal fat extn. esp. from slaughterhouse waste - in static column without circulation, using super critical gas extractant

HAUSSENER E 01.02.79-CH-001000

(16.09.81) *EP-14-685 C11b-01/10 C11b-03/02

31.01.80 as 810035 (068NS) (G) CH-565238 GB1058076 US2118454 US2166160 E(AT BE CH DE FR GB IT NL SE)

Animal fats are recovered and/or refined by extraction e.g. of edible grades of offal in a static column in an autoclave without circulation using a gas at supercritical conditions. The gas may be carbon dioxide, nitrous oxide, ethane, ethylene fluorinated hydrocarbon, etc. The extracted fat may be recovered by melting from the base of the column. (5pp)

UNIL D12 69816 D/38 = EP -35-847
Prodn. of water-holding protein material - from defatted oil-seed meal, for stabilising fat emulsions

UNILEVER LTD 28.02.80-GB-006807

(16.09.81) *WP8102-378 A23j-01/14

26.02.81 as 300803 (367JB) (E) US3645745 FR2370439 US4091120 J50137999 1.Jnl.Ref E(GB)

Prodn. of proteinaceous materials with a high water-holding capacity is carried out by (a) treating a defatted oil-seed meal with an aq. soln. having a pH of 6.0-9.0 to solubilise at least part of the protein in the meal; (b) lowering the pH to 2.0-3.0 to dissociate the protein into sub-units; (c) heating at 80-100 deg.C to aggregate the sub-units and form a water-insoluble protein-contg. material; (d) adjusting the pH to 6.0-8.0; and (e) isolating proteinaceous material by ultrafiltration.

The products are useful as thickeners for stabilising aq. fat emulsions, e.g. in the mfr. of simulated meat products, sausages, pate', etc. (10pp)

VIDE/ ★ D12 70268 D/39 ★ FR 2475-855
Machine to strip skin etc. from food prods. e.g. meat, fish - has friction roller cleaned by rotary brush downstream of stripping blade

VIDEAU Y 19.02.80-FR-003613
(21.08.81) A22c-17/12 A22c-25/17

19.02.80 as 003613 (448DH)

The prod. is displaced along the surface of a flat feed plate to meet secantly the circumference of a friction roller. The roller carries the prod. against the cutting edge of a stripping blade which is tangential to the roller. The edge of the blade is parallel and opposed to the delivery edge of the feed plate.

The periphery of the friction roller is now cleaned with a stiff-bristled brush as it moves between the blade cutting edge and the edge of the feed plate. Brushing takes place over the full, axial length of the friction roller. Brushing is pref. by means of a roller brush rotating on a longitudinal axis parallel to that of the friction roller. If the friction roller and brush are rotated in the same direction, the bristles meet the friction roller surface travelling in the opposite direction. The linear speed of the bristle tips is pref. greater than the speed at the circumference of the friction roller.

Useful for sepn. of skin, rind, tendons, ligaments, muscle tissue etc. from meat, offal, fish, chicken etc. The machine can handle fish and other fragile skins without becoming jammed. The friction roller is cleaned as effectively but more economically than with compressed air jetting. (20pp Dwg.No.1)

KOLL/ D12 30407 A/17 #GB 1598-706
Sausage skin gathering machine - with three roll head carrying out circular motion around inflated skin mandrel centre

KOLLROSS G 16.10.76-DE-646848 (28.12.77-GB-054040)

A32 (A97) (23.09.81) *DE2646-848 A22c-13/02

28.12.77 as 054040 (006AS)

Appts. for shirring tubular food casings comprises a cantilever mandrel, with a casing stop, over which a casing is shirred by a head having three or more circumferentially spaced rollers with arcuate peripheral grooves which match the surface of the mandrel.

The space between the shirring rollers exceeds the mandrel dia. and the head rotates about an axis eccentric to the mandrel axis, so that the casing is both shirred by the rotating rollers and spiralled by rotation of the head for max. compaction. (7pp)

STAU ★ D12 D/39 ★ J5 6099-775
Protein rich shell meat

Sausage skins - produced from aq. solns. contg. about a third by weight of gelatin

EXTRACO AB 04.02.80-SE-000876

A97 (07.09.81) A22c-13

04.02.80 as 000876 (903WB)

Thin edible films, e.g. sausage skins, contain more than 30 wt. % of gelatin (I) produced in known manner from bone, etc. A suspension of (I) is treated with softeners, cross-linkers and opt. reinforcing materials and the skins shaped.

TRIO- ★ D12 D/39 ★ SE 8100-618
Fish forward feed in process unit - is along V-shaped groove by conical rollers extending through wall recesses or by belts parallel to walls

TRIO ENG LTD AS 07.02.80-NO-000325

(07.09.81) A22c-25/08

07.01.81 as 000618 (1161WB)

The forward feed is for a fish processing plant, having a V-

shaped groove along which the fish is moved with increasing speed by means of conical rollers projecting through recesses in the groove walls, or by belts the active part of which runs parallel to the walls. This imparts increasing feed speed towards the bottom of the groove and in the forward direction of movement

JACC/ ★ D12 71476 D/39 ★ US 4287-642
Meat tenderising by array of knives - releasably mounted on head and yielding on contact with bone

JACCARD A R 28.12.78-US-974032

(08.09.81) A22c-07

28.12.78 as 974032 (295)

A meat tenderising appts. has a vertically reciprocating head which advances an array of knives to penetrate the meat. Each knife is releasably mounted on the array by a spring assembly which yields if the knife motion is obstructed e.g. by encountering a bone.

Each knife carries a stripper comprising an end plate supported by rods. The rods are attached to a cross-head which slides on the knife and allows the stripper plate to rest on the surface of the meat while the knife is being introduced. The stripper plate also acts as a guide to support the tip of the knife while it is being advanced towards the meat.

The appts. tenderises meat which may contain bones. The knives do not become broken if they contact a bone. (14pp)

Determining fat content of meat - by measuring specific wt. or vol. deviation of sample in fat non-solvent

CHIBAYAKU GROCERIES 04.12.78-JP-149089

S03 X25 (08.09.81) *DE2947-736 G01n-09/10 + G01f-17

17.09.79 as 076309 (1358NS)

Appts. for measuring meat fat content comprises a container(1) to hold liquid and a meat sample and with a liquid height gauge(4) for measuring displacement and thus fat content. The gauge has fat content calibration indicia vertically spaced and projects upwardly through a lid to receive liquid displaced by operation of a piston pump(3) on the lid(2).

The container may have a rotatable stirrer for dispersing ground meat in the container. Alternatively, liquid may be introduced into the container from a separate vessel through the gauge which can support the vessel above the container. (7pp)

NAHA- ★ D12 71505 D/39 ★ US 4287-820
Appts. for spiral slicing of ham - the ham being rotated about vertical axis while rotary knife moves vertically and horizontally

NATIONAL HAM CO 15.09.78-US-943312

P28 (08.09.81) A23n-07 A47j-17

15.09.78 as 943312 (295PW)

Appts. for making spiral cuts in a ham includes vertically aligned spiked bosses which clamp the ham so that it can be rotated about a vertical axis. A slicing head comprises a rotating blade which lies in a horizontal plane and is carried at the end of a horizontal arm. The arm can be moved vertically to move the knife vertically along the ham, or alternatively the arm can be pivoted about a vertical axis to move the blade horizontally to move it towards the ham.

The apparatus is actuated when an operator moves a control lever. This causes the arm to move horizontally towards the ham and then to move vertically along the ham while a preset horizontal bias force is applied to the blade.

The apparatus is automatic in operation and includes an interlock which prevents the slicing blade from cutting into the ham-supporting bosses. (14pp)

Gland seal for stuffer horn - comprises rigid element swivelling ball-like holder attached to end of horn

CIL INC 25.05.79-CA-328340

Q31 (08.04.81) A22c B65b

23.05.80 as 003104 (295PW)

An extrusion chub container packaging apparatus has a filling horn with a gland seal. A spherical element is mounted on a bulbous end of the filling horn and can swivel while a filling material passes through the filling horn. An annular seal surrounds the spherical element and contacts a casing which is

drawn over the filling horn during a filling operation.

Pref. the spherical element is made from high density plastics and the annular seal from stainless steel or anodised aluminium.

The appts. extrudes comminuted meat, cheese or explosives into a casing. The seal prevents the material from flowing upstream into the unfilled portion of the casing. (9pp)

RALS ★ D13 69876 D/39 ★ BE -888-807
Intermediate moisture content pet feed - having fat encapsulated sauce components as coating on the feed particles
RALSTON PURINA CO 15.05.80-US-150272
C03 (28.08.81) A23k
14.05.81 as 888807 (1251AT)

Feed of intermediate water content for domestic pets comprises a mixt. of proteinaceous and farinaceous components of 15-55 wt.% moisture content coated with particles of a sauce-forming mixt. encapsulated in fat. These particles are resistant to penetration by moisture during storage but are converted to a sauce by addn. of a hot aq. liq. Pref. the fat used has m.pt. 38-66, esp. 43-54, deg.C, and is used at at least 20 wt.% on the particles.

The coating of sauce-forming particles is pref. 0.25-10, esp. 1-4, wt.% of the feed, and the sauce-forming components include a polysaccharide thickener, pre-gelled starch, aroma agent and soluble carbohydrate, pref. also 0.1-5 wt.% of a flow regulator. The feed has pH 4-6 and includes an antimicrobial.

The compsn. retains its ability to form a sauce during prolonged storage, and formation of the sauce does not require activation by the natural moisture content of the food. (34pp)

SWIF ★ D13 69898 D/39 ★ CA 1106-681
Low calorie fat substitutes - comprises blend of glycerol fatty alcohol di:ether(s) and/or their mono:ester(s)
SWIFT & CO 27.12.77-US-864157
E17 (11.08.81) A23d-05
15.11.78 as 316253 (955PW)

Low calorie food compsns. contain, as replacement for at least part of the lipid content, dialkyl glyceryl ether cpds. of formula $R_1OCH_2CH(OR_2)CH_2OR$ and/or $R_1OCH_2CH(OR)CH_2OR_2$ where R_1 and R_2 are same or different satd. or unsatd. straight or branched alkyl of 8-30C, and R is H or R_3-CO- where R_3 is 3-21C straight or branched satd. or unsatd. alkyl.

The cpds. are not attacked by digestive enzymes, and are not absorbed, and so contribute no calories to food. Blends of the cpds. may be prepd. which closely simulate the functional props. of the lipids they replace. (18pp)

 (16.09.81) A231-01/36

20.02.81 as 101232 (295BZ) (E) US3162536 GB1180686 FR2203596 US3901983 US2685519 US1754266 E(AT BE CH DE FR GB IT LI LU NL SE)

Peanuts are pretreated to remove tannin, odour and impurities. They are mixed with water and then ground to form a mash which is subsequently dewatered to make a dough. The dough is divided into pieces which are treated to yield a product of predetermined physical characteristics. Pref. the treatment of the dough pieces involves a drying process which leaves a shape-sustaining amount of water. The pretreatment pref. is effected by saline soaking and rinsing.

Pref. the pretreatment is effected using a saline solution in which the peanuts are heated to 70 to 100 deg. C for 1 to 5 mins. The peanuts are rinsed and then pressure cooked in water at 120 deg. C for 15 to 30 mins. The resulting mixture is ground to form a mash which is partially dewatered to make a non-runny dough with a moisture content of 20 to 50 percent by weight. Starch may be added.

The resulting peanut product is water-soluble, odourless and tasteless, yet is still high in protein content. The product may be ground into flour but it is not formed by reconstituted flour. (19pp)

18.04.78 as 015250 (964AS)

Mix suitable for prepn. of spreadable butter-substitute prod. having an oil content of 20-80 wt. % and water content of 10-80 wt. % comprises (a) 0.01-80 (0.1-30) wt. % of an emulsifier capable of forming water-in-oil emulsion; and (b) 2-99 (2-80) wt. % of a hard

fat such that the solid fat index in a butter-substitute prod. prepd. from the mixt. is 2-35% at 10 deg.C, 1-20% at 21 deg.C, 0.9-15% at 27 deg.C, not more than 8% at 33 deg.C and not more than 5% at 37.8 deg.C. The mixt. pref. contains 5-97 wt.% of an oil.

Pref. the emulsifier is a monoglyceride, diglyceride, polyglycerol ester of fatty acid, lecithin, and/or a sterol. The mixt. pref. further contains NaCl and/or KCl to improve taste.

The mixt. is shelf stable at high temps. and does not require high capital investment to produce. (11pp)

UNBI-★ D13 70347 D/39 ★GB 2071-478
Treatment of seeds for foodstuffs - by comminution, impregnation with liq. additive, compression to flakes, and drying

UTD BISCUITS UK LTD 05.02.81-GB-003629 (14.02.80-GB-005087)

(23.09.81) A231-01/36

05.02.81 as 103629 (478AT)

Foodstuff is prepd. as follows: (a) a comminuted edible seed prod. (I) is impregnated with a liq. additive (II); (b) pressure is applied so that (I) is formed into flakes; then (c) the (I) flakes are dried to a predetermined H₂O-content.

Step (a) seeds (wheat (pref. soft biscuit wheats) etc.) are cut into 2-8 pref. 3-7 esp. 5 or 6 pieces of max. dia. 2-5 mm. (II) is pref. aq. NaCl brine (to give (I) salt content 0-3%, pref. 2.5% by wt), or an aq. sugar soln. The (II) soln. pref. also contains an emulsifier, and opt. a phosphate. Impregnated (I) has H₂O- content not above 20%, which is pref. increased to 22-27% by steaming at 70-95 deg. for 5-20 min. prior to step (b). Step (b) flakes (pred. by rolling) have thickness 0.6-2 mm, pref. 0.8- 1.2 mm for wheat, 0.6-0.8 mm for rice, and 1.4-2 mm for barley. Step (c) drying is with air at 85-95 deg. to H₂O-content pref. 4-12% by wt.

Rapid process allows wheat seeds etc. to be used, and affords a prod. which is readily digestible and which is highly suitable for incorporation into other foodstuffs (e.g. as extender for sausages or burgers, etc.). In addn., the prod. has improved capacity to absorb H₂O. (5pp)

BRAI-★ D13 70348 D/39 ★GB 2071-479
Prepn. of instant cooking alimentary pastes - by low temp. steam treatment, water addn., then further low temp. steam treatment

BRAIBANTI & C SPA 10.03.80-IT-020483

(23.09.81) A231-01/16

23.02.81 as 105610 (478BZ)

Instant cooking pastas (based on cereal or other flours) is prepd. as follows: (a) a paste from an extrusion stage (water- content 25-35%) is treated with steam at below 100 deg.C/atmos. pressure; (b) paste is wetted to water-content 40-55%; (c) paste is allowed to stand; then (d) the paste is re-treated with steam at below 100 deg./atmos. pressure.

Steps (a) and (d) are pref. for 2-5 min. with steam at 95-100 deg. Step (c) stand is for pref. 10-25 min.

Method is rapid, uses steam at not above 100 deg., is inexpensive, may be operated on a continuous basis, and uniformly cooks and gels the contained starch. In addn., paste does not stick to the vapourization belt in step (d). (3pp)

POLL-★ D13 70420 D/39 ★GB 2071-692
Removal of nitrosamine from beverages - by exposure to visible light, then storage in the dark

POLLOCK & POOL LTD 18.03.81-GB-009043

E16 (23.09.81) C12h-01

18.03.80 as 009043 (478KB)

The nitrosamine (I) content of beverages is reduced as follows: prior to its first packaging for sale the beverage is illuminated with visible light then stored in the dark at -5 to +30 deg.C.

Visible light pref. has substantial emission in the yellow region. The beverage pref. flows by convection past the light and is heated as it is close to the light. Dark storage is pref. for at least 3 days. Opt. after treatment the beverage may be treated with an adsorbent to remove any SH cpds. formed.

Simple method effectively removes (I) from a variety of (opt. distd.) alcoholic beverages (whisky, etc.) but does not adversely affect the flavour. (4pp)

B03 E13 (11.08.81) A231-01/22 C07h-01/08

09.01.80 as 001215 (5AS)

Process comprises treating steviolglycoside soln. contg. impurities with magnesium silicate aluminate for removing impurities through adsorption and recovering steviolglycoside from unadsorbed fraction.

Magnesium silicate aluminate is a good adsorbent for stevia extract and the impurities of stevia extract including colourant protein, etc. can be removed effectively without adsorbing steviolglycosides. Exhausted magnesium silicate aluminate can be regenerated easily by treating with aq. alkali soln. and washing with water. (8pp)

IMAR/★ D13 70642 D/39 ★J5 6099-77
Syoyu-like seasoning prepn. - by adding fermented liq. for aminoacid(s) to water, adding syoyu-koji and then brewing conventionally

IMARUT 07.01.80-JP-000771

(11.08.81) A231-01/23

07.01.80 as 000771 (5RH)

Method comprises (a) adding the fermented liq. for amino acid, in water, (b) adding 'syoyu-koji' to it and (c) brewing 'syoyu' conventionally.

'Syoyu'-like seasoning which has high nitrogen content of 2.6-2.7%, keeps specific flavour or syoyu, shows strong taste and is free of amino acid odour and burnt smell, can be prepd. inexpensively.

For the fermented liquid that for glutamic acid can be used alone or pref. together with that for alanine. For glutamic acid-fermented liquid alone it is added to water so that glutamic acid content is 20-50 mg/ml. and when using it together with alanine-fermented liq. they are added to water so that glutamic acid content and alanine content are above 10 mg/ml. and above 5 mg/ml. and their sum is 15-50 mg/ml. Excellent salt-reduced 'syoyu' can be also prepd. using the method. (5pp)

POLY-★ D13 70643 D/39 ★J5 6099-782
Preventing discoloration of foods - by addn. of cyclic condensed phosphate and opt. sodium ultra or hexa-meta-phosphate

POLYPHOSKAGAKU KEN 10.01.80-JP-001676

E34 (11.08.81) A231-03/34

10.01.80 as 001676 (5AS)

Process comprises adding to the food (a) 0.2-0.8 w/w% cyclic condensed phosphate such as sodium trimetaphosphate or tetrametaphosphate, or (b) 0.2-0.8 w/w% of the mixt. composed of 50-90 w/w% cyclic condensed phosphate and 50-10 w/w% sodium ultraphosphate having reticular structure or sodium hexametaphosphate having linear structure.

Cyclic condensed phosphate is easily hydrolysed to linear form during heat-processing of the food and is bonded (a) to amine for preventing Maillard's reaction, (b) to dimethylamine, trimethylamine, etc. in marine foods and (c) to antocyanin-type pigment in fruit juice, etc. for preventing the discolouration of those foods. (3pp)

Heat fusible oblate starch film mfr. - by dissolving ordinary starch in water, dissolving starch contg. amylose in hot water, mixing the solns., heating, etc.

SHIBAOMI T 17.01.80-JP-004157

A32 (A11) (14.08.81) A231-01/19 B29c-13

17.01.80 as 004157 (59PW)

Ordinary starch (e.g. potato and sweet potato starch) (100 pts.wt.) is dissolved in water (700-1000 pts.wt.). Starch contg. at least 50wt.% of amylose (e.g. high amylose corn starch) (5-20 pts.wt.) is dissolved in hot water (50-200 pts.wt.). The 2 solns. are mixed together and the mixt. is heated at 60-100 deg. C to gelatinise the starch. The gelatinised starch soln. is coated and dried on a rotating drum to provide fusible oblate starch film.

The amylose is a linear polymer of glucose, etc. to provide film with heat sealability and gas barrier activity which provide airtight packaging of prods. The gas barrier activity and sealability of edible starch film enables packing of cake and medicals. The film is used in lieu of capsules to reduce packaging cost markedly and can be swallowed easily. (2pp)

NEST D13 54470 T/34 ★ J8 1036-889
Acid particles - for reconstituting yoghurt, coated with edible fat to regulate solubility
SOC PROD NESTLE SA 10.02.71-CH-001943 (09.02.72-JP-014307)
(27.08.81) *BE-778-316 A23c-09
 09.02.72 as 014307 (BZ)
 Acid compound of regulated solubility is prepared by coating a solid acid particle (citric, lactic acid in size 10-100 micron) or incorporating it in a solid support with an edible fat (hydrogenated butter oil) solid at room temp. and containing an emulsifying agent. Antioxidant and flavours may be added. The protective coating is selected to liberate acid at the desired rate (0.5-2 h) in water to give yoghurt of the required consistency. (J47019060) (2pp)

(08.09.81) A23c-19/02
13.06.79 as 048525 (295BZ)

A cheese product has a longitudinal fibrous texture and is formed from a cheese capable of forming a fibrous texture when stretched. The cheese is heated and then extruded as a continuous strand. A longitudinal pulling force is continuously applied to the strand to induce the desired longitudinal fibrous texture, and to reduce the cross-sectional size of the strand. The strand is finally cooled. Pref. tension is maintained on the strand during the cooling step. The strand is eventually severed into predetermined lengths.

The product is elongate with a longitudinal fibrous texture. It is eaten by pulling off strips. Italian cheeses are particularly suitable for making the product because of their natural stringy properties. (6pp)

Vertical plate freezer for industrial prodn. of frozen food - has prod. ejector platforms linked to hydraulically displaced lifting beam

BRODRENE GRAM A/S 19.05.80-DK-002177
Q75 (28.08.81) F25d
15.05.81 as 888821 (448BZ)

A vertical plate freezer for industrial prodn. of frozen food prods. The freezer has a set of spaced, vertical plates between which prod. is compressed and frozen. The gap between each pair of adjacent plates is closed at the bottom by an elevator platform which can rise to lift frozen prod. clear of the plates.

All the elevator platforms for a set of freezer plates are now mechanically linked to a pair of lifting mechanisms, one at each end of the set of plates. Pref. all the platforms are linked to the top of a lifting beam extending between a pair of fluid power cylinders, partic. hydraulic. The linkage between each platform and the beam is pref. a telescopic rod which is extended by a supplementary linkage actuated by the ascent of the lifting beam.

Used lifting frozen prod. from the spaces between vertical plates of an industrial freezer. The elevating platform actuating mechanism is much more compact than previous rack and pinion drives. The freezer is thus simpler to install and offers better access to the freezer plates from all sides. (15pp)

During the treatment of a liq., e.g. the deionisation of water, a sample of the liq. is fed through a by-pass tube into a meter. In the meter, the liq. sample is forced by pressure through a filter. Either the time taken for a given vol. of the sample to pass through the filter, or the vol. filtered in a given time, is used to indicate the colloidal or fouling index of the liq. The pref. meter contains a sieve employed to support a membrane, through which the sample flows into a chamber contg. a level switch connected to a timer so the vol. of filtrate obtd. in a given time can be obtd.

Used during reverse osmosis or other purificn. treatments using expensive membranes. By measuring the colloidal, fouling- or fouling- index of water etc., the blockage and destruction of expensive membranes can be prevented. (14pp

Vertical axis aerating rotor for waste water - can be operated at higher speeds than previous inverted cone turbine rotors

SIMON HARTLEY LTD 10.01.76-GB-000927
(27.08.81) *BE-849-315 B01f-03/04 B01f-07/16 C02f-03/16 C02f-07 10.01.77 as 001844 (448RP)

The rotor comprises a flat plate, pref. circular, which rotates in a horizontal plane about the vertical axis. The underside of the plate is fitted with several, angularly spaced, similar blades extending radially from a central region to the periphery.

The depth of each blade increases from each end to a max. at a crest between the ends. The lower edge of each blade is fitted with a plate which forms wings extending from both sides of the lower edge, at least for part of the length of the blades lower edge between the outer end and the crest. The outer end of each blade pref. extends beyond the periphery of the horizontal plate.

Baffles are fitted in the tank below the rotor to prevent turbulence in this zone. The baffles are pref. four plates set in vertical planes and forming a right-angled cross on a central axis coinciding with the axis of the rotor.

The higher speeds permit the use of smaller, more economical drive motors and gear boxes. (J52085761) (4pp)

Waste water contg. organic anions treatment - by treating with anion exchange soln., isolating and dewatering dirt layer and recovering solvent

MITSUBISHI CHEM IND KK 10.04.74-JP-040448
F06 J01 (29.08.81) B01d-11/04 C02f-01/26
10.04.74 as 040448 (AT)

Waste water contg. organic anionic materials, e.g. dyeing wastes, is treated with an anion-exchange soln; the dirt layer formed between aq. and organic solvent phases is isolated and dewatered by heating at 60-150 deg.C. and the org. solvent is recovered from the heat-treated material.

In an example waste water (COD 630mg/l) was treated with an anion-exchange soln. (10% Cg-45 higher alkylamines in kerosine). The waste water was adjusted to pH 4.5 with H₂SO₄ and treated with the solvent in an extn. tower. The treated water (COD 130 mg/l) was continuously removed and the dirt layer formed between the aq. and org. and solvent phases was collected and pptd. to separate the dirt layer and organic solvents. The dirt layer was distilled to obtain a mixt. of water and kerosine from which kerosine was isolated. The distn. residue was a slurry contg. the organic solvent and water from which the organic solvent was isolated. The alkylamine-kerosine solvent in the dirt layer was completely recovered. (J50133163) (4pp)

Two-stage activated sludge purificn. of waste water - uses higher rate BOD loading in first than in second stage

MACH HUBERT W CO (HBMF) 10.09.76-DE-640875
(30.12.80) *BE-858-431 C02f-03/02

09.09.77 as 522949 (GW)

The waste water undergoes a first stage aeration with activated sludge at a high rate B.O.D. loading. This is followed by clarification, recycling of required sludge and disposal of excess sludge. The clarified liq. is then subjected to a second stage aeration with activated sludge at a lower rate B.O.D. loading than the first stage.

The first stage biological loading in 10 kg. BOD₅/m³ per day with an activated sludge rate of at least 2 kg BOD₅/kg. of dry matter per day. Treated effluent from the first stage is passed through an intermediate clarifier to undergo rigorous sepn. of first stage sludge before being passed to the second stage biological treatment. Sufficient excess sludge is taken out of the cycle at the intermediate clarifier to retain a young sludge condition. The second stage biological treatment is of the extended aeration type of activated sludge system operating at low B.O.D. loading.

The process provides optimum combination of high rate B.O.D. loading in the first stage with extruded aeration low rate loading in the second stage. The combination offers max. treatment capacity to a high degree of purificn. in a compact, economical installation. Bul. 48/30.12.80. (2pp)

Water thermal deaerator - has perforated plates, steam heat carrier and steam cavity sensitive to pressure fluctuations

TRIFONOV N N 05.02.79-SU-721718

Q72 (07.01.81) C02f-01/20 F22d-01/32

05.02.79 as 721718 (1513WD)

The thermal deaerator is used for efficient removal of corrosive gases from water, of especial use in heating power plants. Efficiency is improved by using a water drain and steam cavity joined to connecting pipe by a ring of perforations, producing dynamic pressure equilibrium.

The appts. contains a deaeration column (1) with water pipe (2), perforated plates (3) and water discharge drain (4). The connecting pipe (5) with perforations (6) and steam input pipe (7) joins the column (1) with reservoir tank (8) of deaerated water.

The water flows through branch pipe (2) into column (1), perforated plates (3), through drain (4) pipe (5) into reservoir (8). Foam leaves channel (7) and simultaneously, heats water stripping from plates (3) (raising pressure), and enters cavity (9). When pressures of pipe (5) and cavity (9) are equal, deaeration efficiency is optimal and sensitive to pressure fluctuations. (ul.1/7.1.81. (2pp))

TIGWELL/★ D15 71553 D/39 ★US 4288-206
Automatic multiple water sampler - has glass chambered syringes with plastics pistons for sampling and discharging water

TIGWELL DC 15.08.79-US-066518
J04 Q56 (08.09.81) F04b-07 F04b-21/08
15.08.79 as 066518 (67BZ)

Sampler for delivering multiple independent water samples comprises a drive bar mounted in a frame for linear reciprocation and glass chambered syringes having movable plungers coupled to the drive bar and mounted in the frame with their axes parallel to the direction of the bar reciprocation. A valve body on the frame has a glass chamber opening to the chambers of the syringes and an inlet and outlet for each syringe.

A valve spool shiftably mounted in the valve body chamber has relieved regions for alternately connecting the syringe chambers with the inlet and outlet when the spool is shifted. The plungers have non-wetting plastics pistons in wiping contact with the syringe chambers and the valve spool is formed of non-wetting plastic.

The appts. is esp. suitable for use with water sorption columns because the samples are delivered under pressure. In the appts. plastics parts cooperate with glass parts so that leakage arising from plastics deformation when plastics parts coact is avoided. (1pp)

Continuous determ. of total organic carbon in aq. halide solns. - by oxidn. in presence of mercuric mono:halide, then UV radiation

ENVIROTECH CORP 21.04.80-US-142577 (07.03.80-US-128066)
J04 S03 (08.09.81) G01n-31/12 G01n-33/18
21.04.81 as 142577 C.i.p.4273558 (478BZ)

Total organic C (I) in each of several discrete aq. samples contg. halide ion is determined as follows: (a) an aq. soln. contg. an oxidising agent (II) and HgX(+) (X is halogen) but no insol. ppt. is continuously passed to a reactor; (b) samples are added in succession to the reactor; (c) the soln. and each sample are irradiated with electromagnetic energy from a source immersed in the aq. soln. to oxidise organic matter to CO₂; (d) produced CO₂ is removed and (I) in the gas is measured.

Method is rapid, accurate, and avoids the known suppression of the rate of oxidn. of organic matter by halide ion interference. Method is esp. useful for determining the (I)-content of a no. of sea-water samples. (8pp)

Electrochemical process using earthed porous bipolar electrode - as membrane esp. for removing heavy metal from water and sewage

ENVIRON SCI ASSOC 29.11.79-US-098689 (20.10.78-US-953335)
J03 M25 X25 (08.09.81) C02f-01/46 C25c-01
29.11.79 as 098689 (1501BZ)

An electrochemical processing system employs an earthed porous bipolar electrode, the two sides of which are maintained at different electrical potentials w.r.t. reference electrodes. Material, contained in a soln. contacting one side of the electrode, is reacted to form a product which is deposited on that side of the electrode, passes through the electrode and then reacts with a second soln., contacting the other side of the electrode, to form a second product. This second product may then be stripped into the second soln.

The system is relatively inexpensive and esp. useful for removing trace quantities of heavy metals and their complexes from naturally occurring water, waste water and sewage plant effluent and sludge. Other uses include removal of anionic contaminants (e.g. cyanide) and organic contaminants (e.g. Chlordane) from aq. solns. and chemical synthesis e.g. methanol oxidn. to aldehyde or formic acid. (9pp)

Skimming appts. with baffles preventing debris entry - with cleaning fingers interdigitated between baffles and rocked by skimmer motion

URDANOFF H D 24.10.79-US-087745 (31.08.78-US-938644)
Q42 (08.09.81) E02b-15/04
24.10.79 as 087745 (295BZ)

A skimming appts. removes a floating layer from a body of liquid. The skimmer is semi-immersed in the liquid and has an inlet opening and a hollow interior compartment. The skimmer is supported so that it tilts from a recumbent position generally parallel to the liquid surface, to an inclined position in which the floating layer is admitted through the inlet. Contaminated liquid may be removed from the compartment.

Laterally spaced baffles opposite the inlet are mounted on the skimmer support for blocking debris. Cleaning members protrude forwardly between the baffles from the skimmer for vertical movement with respect to the baffles. On tilting of the skimmer, the members push away the trapped debris.

For continuously removing a top floating contaminant layer, specifically a floating tramp oil layer, from clarifying reservoirs such as sumps, pits or lagoons. (9pp)

SHAN/★ D15 71603 D/39 ★US 4288-325
Filter for conventional water tap - has two part body holding diffusing screen above filter pad

SHANN T P 09.10.79-US-082806
(08.09.81) B01d-25/02
09.10.79 as 082806 (1358KB)

A filter has upper and lower separable components, the upper attachable to the tap and with a diffusing screen in the flow passage and bowed to shallow dome shape. The lower component has a single thin porous filter pad no more than several mm thick to receive water sprayed through the screen.

The pad is supported on a mesh screen and is held against this by a sealing ring, the sandwich being rigidly secured between projections from the internal walls of both components. The diffusing screen is less than 1/4 inch above the filter to reduce impact force, and the lower component has an exit chamber delivering water in a steady stream. (4pp)

 Determn. of a substrate (I) in a sample is carried out by (a) converting the substrate to a product in a 1st reaction stage and converting the prod. back to the substrate in a 2nd reaction stage, where at least one stage is enzyme-catalysed and one of the reactions is accompanied by the conversion of an indicator substrate to an indicator product; and (b) determining the loss of indicator substrate or the gain of indicator prod.

The process is esp. applicable to enzyme immunoassays, where (I) is a product formed by the enzymatic action of the free or bound enzyme-ligand or enzyme-antibody conjugate on a suitable substrate. It is stated to increase the sensitivity of the immunoassay (e.g. for serum digoxin) by a factor of 50-100. (23pp)

Bio-assay for determn. of mutagenic effect - based on radial diffusion of mutagen

MASSACHUSETTS INST TECH 17.09.79-US-076199
(16.09.81) *WP8100-726 C12q-01/68
 25.08.80 as 901832 Based on WP8100726 (367WB) (E) US3819490 US4066510 US3493772 GB-774155 3.Jnl.Ref E(CH DE FR GB LI)
 The mutagenicity of a test agent is determined out by (a) treating a culture of living cells with the test agent under conditions such that a band of living mutant cells will form if the agent is a mutagen, (b) measuring a radius within the band, and (c) using the radius to determine the mutagenic effect of the agent.

In the case of chemical mutagens, the method can be used to determine both the minimal mutagenic concn. (MMC) and the half-life of the mutagen. (51pp)

Mfg. transfer vector contg. sequence for mammalian peptide - with opiate agonist or antagonist activity, and transformed microorganisms

UNIV OF CALIFORNIA 10.03.80-US-128711
B04 (16.09.81) C07c-103/52 C12n-01/20 C12n-15 C12p-21/02
 07.03.81 as 101678 (1251NS) (E) No-Citns. E(AT BE CH DE FR GB IT LI LU NL SE)

A new DNA transfer vector (A) includes an expressible operon, esp. the lac operon, in which is inserted a deoxynucleotide sequence of naturally occurring mammalian codons coding for a peptide with opiate agonist or antagonist activity. Orientation of the inserted sequence is such that the peptide can be synthesised. Esp. the peptide is beta-endorphin (I) from the mouse or humans, and the sequence may also comprise a synthetic

Gly-human-beta-endorphinyl glycine or 31-Gly-human-(I) amide. Also new are (a) the plasmid p beta gal-end (ATCC 40024); (b) microorganisms transformed with A, specifically E. coli RR1 ATCC 31614; and (c) synthesis of (I) by cultivating these transformed microorganisms.

(I) is known as an analgesic; for treating mental disorders (including schizophrenia) or gastrointestinal diseases, and possibly as a long-term birth-control agent. (36pp)

ICIL ★ D16 70190 D/39 ★EP --35-831
Glutamate dehydrogenase gene contg. microorganism - used to produce protein from methanol and ammonia, microorganism has been genetically modified

IMPERIAL CHEM INDS LTD 07.03.80-GB-007849
C03 (D13) (16.09.81) A23k-01 C12n-01/32 C12n-15
 10.02.81 as 300538 (1251KB) (E) No-Citns. E(AT BE CH DE FR GB IT LI LU NL SE)

Genetically modified microorganisms are made by transferring DNA contg. at least one gene from a donor microorganism, carried on a plasmid vector formed from a multicopy plasmid, into a recipient microorganism deficient in this gene. Specifically the gene transferred codes for glutamate dehydrogenase (GDH) and the modified microorganism expresses this enzyme.

Opt. the gene is transferred via at least one other intermediate microorganism, and the pref. recipient is methylotrophus methylotrophus NC1B 15015. The gene donor is esp. E. coli. Also claimed are (a) the modified microorganisms themselves, specifically M. methylotrophus NC1B 11585 and intermediates plasmids formed during their prepn. and (b) single cell proteins and amino acids made by growing these cells on a medium contg. methanol plus ammonia or ammonium.

The GDH gene improves conversion of substrate carbon to cellular carbon since it allows the microorganism to assimilate ammonia by the more e-ficient GDH pathway. The single-cell protein prod. is useful in human and animal nutrition. (20pp)

 10.03.81 as 301009 (+5.5.80-US-146320) (1251RP) (E) No-Citns. E(BE CH DE FR GB IT LI NL SE)
 The plasmid vectors E.coli CSH50 (pUC 1012; pUC 1013; pUC 1015; pUC 1016) and E.coli RR1 (pUC 1022; pUC 1023), with NRRL deposit numbers B-12106, -12107, -12150, -12151, -12183 and -12184, respectively, are new. Also new are the plasmids pUC 1012; pUC 1013; pUC 1015; pUC 1016; pUC 1022 and pUC 1023; they are characterised by restriction maps reproduced in the specification.

pUC 1012 and 1013 are prepd. by linearising the plasmids pU6 and pBR322 and ligating the resulting linear DNA. They can be converted to the other new plasmids by digestion with a restriction endonuclease, then ligating linear DNA fragments formed.

The plasmids can be modified by incorporation of a length of DNA, e.g. genes coding for somatostatin, rat proinsulin, interferon or proteases, and then transformed into a host (esp. bacterial) which will then produce the cpd. coded. They can be used in industrially-important microorganisms, e.g. Streptomyces, e.g. to increase prodn. of antibiotics from these

Antibiotic KA 3093 (I) having a ... of 100-1000 ...

Formula of C₂₃H₃₁O₁₂N. (I) is used as antibacterials, parasiticides or herbicides containing KA-3093 as an active ingredient.

(I) is prepd. by cultivating a strain of genus *Streptomyces* and capable of producing KA-3093 (specifically, *Streptomyces* sp. KA-093, FERM-P No. 5285) and recovering KA-3093 from the culture. (5pp)

MAB/★ D16 70644 D/39 ★J5 6099-792
ATP-producing enzyme prodn. - by culturing *Bacillus thermophilus* to produce acetate-kinase, extracting crude prod., adsorbing on carrier and eluting

IMABORI K 14.01.80-JP-002900
B04 (11.08.81) C12n-09/12 C12r-01/07
14.01.80 as 002900 (5KB)

Method comprises (a) culturing the microorganism which can produce acetate-kinase, (b) obtg. the crude acetate-kinase soln. by extracting intracellular enzyme, (c) treating with the water insol. carrier (I) to adsorb acetate-kinase and (d) eluting. In (I), R₁, R₂ are H or SO₃Na; and R₃ is water insol. high molecule. The water insol. carrier (I) adsorbs acetate-kinase selectively and so acetate-kinase can be refined easily. As the microorganism, *Bacillus thermophilus* is used. (5pp)

AGEN★ D16 70645 D/39 ★J5 6099-793
Pristanol prepn. from pristane contg. culture medium - using *Nocardia* spp. and adding nonionic surfactant to culture medium

AGENCY OF IND SCI TECH 12.01.80-JP-002397
E17 (11.08.81) C12p-07/04
12.01.80 as 002397 (140BZ)

Pristanol is prepd. by cultivation of *Nocardia* spp. (e.g. *Nocardia* sp. BPM 1613, FERM-P No.1609) by oxidising pristane which the medium contains as a main carbon source. The improvement comprises adding a nonionic surfactant to the medium.

Coagulation of a strain is prevented and oxidn. rate does not reduce. No accumulation of pristanoic acid is observed. Accumulation of pristanol is accelerated to attain the max. concn. of pristanol in a short time. Any surfactant which has no physiologically inhibitory activity on the strain may be used, e.g. sorbitan fatty acid esters (e.g. Span 20 RTM), polyoxyethylene sorbitan fatty acid esters (e.g. Tween 40 RTM), polyoxyethylene fatty acid esters (e.g. Emanon 1112, RTM), fatty acid monoglycerides (e.g. Nissan Monogly MB, RTM) and polyoxyethylene alkylphenol mono- or diphosphates. These surfactants are added in an amt. of at least 0.3 g, pref. 0.5-5.0 g, per litre of the culture. (6pp)

MITP★ D16 70646 D/39 ★J5 6099-795
Polysaccharide prodn. - by cultivating pseudomonas microorganisms in medium contg. methanol as main carbon source

MITSUBISHI PETROCH KK(MITP) 06.01.80-JP-000225
(D17) (11.08.81) C12p-19/04
06.01.80 as 000225 (140WB)

Prodn. comprises cultivating *Pseudomonas* sp. CC-163 (FERM-P 5326) or *Pseudomonas* sp. CC-173 (FERM-P 5327) in a medium contg. methanol as main carbon source and recovering the produced polysaccharide from the culture. Cultivation is pref. aerobic and at 28-30 deg.C and pH 6.5-7.5 for 4-5 days by shake culture or 3-4 days by aeration-stirring culture.

The polysaccharide is (1) acidic (2) water soluble; insoluble in methanol, ethanol and acetone, (3) a white cotton-like or fibrous substance in the dry states, and the aq. soln. is colourless and clear, and (4) has viscosity (1 v/w% aq. soln.) of 430 cps (sp. CC-163); 400 cps (sp. CC-173), (5) elementals analysis of 38.7%C, 5.7%H and 0.3%N for sp CC-163 and 38.5%C, 5.8%H and 0.3%N for sp. CC-173 and (6) is constituted by sugar (as hydrolysed with 2N H₂SO₄ at 100 deg.C for 6 hrs.): sp. CC-163: glucose:mannose = 2:1; sp. CC-173: glucose:mannose = 3:1. (6pp)

MARZ★ D16 70648 D/39 ★J5 6099-798
Reagents for determn. of purine nucleoside phosphorylase activity - adenosine deaminase and haemolysed blood, comprises substrate soln., enzyme suspension, reaction stopping soln. and colour reagents

MARUKO SEIYAKU KK 11.01.80-JP-002419
B04 (11.08.81) C12q-01/26 G01n-31/22
11.07.80 as 002419 (140NS)

Reagents for determn. of purine nucleoside phosphoarylase (PNP) activity, adenosine deaminase (ADA) activity or guanase activity in blood, haemolysed blood or culture consisting of (1) a substrate soln., (2) an enzyme suspension, (3) a reaction stopping soln., and (4) a combination of colour reagents (a) and (b). Pref. the substrate soln. comprises inosine, sodium azide and a 0.05-0.2M buffer soln. of pH 7-8; or adenosine, sodium azide and a 0.05-0.2M buffer soln. of pH 7-8; or guanine, sodium azide and a 0.05-0.2M buffer soln. of pH 6-7.5. Pref. (2) is a 1.5-4M ammonium sulphate suspension or 40-60% glycerin soln. of xanthine oxidase (XOD) or XOD and PNP. Pref. (3) is a 0.1-0.3M citric acid soln. or a 0.1-0.2N hydrochloric acid soln. Pref. (4) the combination of colour reagents comprises (a) a colour reagent comprising 3-methyl-2-benzothiazolinone-hydrazone hydrochloride, peroxidase and a 0.1-0.3M buffer soln. of pH 3-4 and (b) a colour reagent comprising N,N-di(m)ethylaniline and a 0.1-0.3M buffer soln. of pH 3-4.

The determn. is simple and accurate. (6pp)

KURS★ D16 70730 D/39 ★J5 6100-605
Hollow thread element - used as filter for soln. contg. solid suspension

KURARAY KK 16.01.80-JP-003819
F07 J01 (D13) (12.08.81) B01d-13
16.01.80 as 003819 (32DJ)

A hollow thread element comprises hollow threads bound together and adhered at their ends. At the end parts the threads are divided into bundles. An end plate pref. provides spaces corresp. to the distance between each bundle. The end plate opt. has a slant surface.

This hollow thread element is useful as a filter for a soln. contg. solid suspensions, e.g. such a fermented liq. as soybean sauce or sake, an (in)organic pigment suspending soln., an oil dispersing soln., emulsion, latex, paint, etc. Owing to the spaces at the end plate, a soln. easily penetrates between the hollow threads and flows along the lengthwise of the thread without cross flowing. The smooth flow of the soln. washes away solid suspensions from the surfaces of the threads, so the solid suspensions do not accumulate in the spaces between the threads. (5pp)

MORG D16 41464 C/23 = J8 1036-888
Lactose decomposition prod. soln. prodn. - using beta-galactosidase in vessel divided by dialysis membranes

MORINAGA MILK KK 24.11.78-JP-145686
(D13) (27.08.81) *WP8001-034 A23c-07/04
24.11.78 as 145686 (1412AS)

In the prodn. of a lactose decomposition prod. soln. a container is divided into compartments by one or more dialysis membranes. A first solution of edible material containing 4-20 wt.% lactose and a second solution containing crude or refined beta-galactosidase in the proportion 30-250, pref. 62.5-250 units for each 1 g of lactose in the first soln. are put in adjacent compartments. Lactose in the first soln. enters the second soln., where it is decomposed. Lactose decomposition soln. recrosses the dialysis membrane(s) to enter the first solution.

The enzymic reaction is pref. conducted at 0-10 deg.C, and dialysis membrane form is such as to afford as great an area of contact as possible between the first and second solutions. Decomposition giving a good quality prod. is effected without special methods, e.g. pressurisation, etc., being necessary. (J55071445) (10pp)

HAYB D16 28846 V/15 = J8 1036-915
Intracellular enzymes extn. from microorganisms - using urea soln. without inactivation of prods.

KEN HAYASHIBARA 02.09.70-JP-076857
(27.08.81) *US3801-461 + C12n-09/10
02.09.70 as 076857 (22DJ)

In extn. of transglucosidase from cell body of fungi belonging to the genus *Mucor*, use is made of aq. urea soln. of 1-6 mole concn. The fungi usable include *Mucor Javanicus* IFO 4570. The fungi are cultivated in a culture medium after conventional manner, and the cell body is collected by centrifugation, filtration, etc., followed by washing with water. Thus collected cell body is added to aq. urea soln. of 1-6 mole concn. and the soln. is kept or agitated for 5-100 hrs. at 30-50 deg.C. Then urea is sepd. by dialysis and the cell body is sepd. from the soln. and then fractional pptn, chromatography, etc. is conducted to give pure enzyme. (3pp)

Serum levels of uric acid determination - using uricase-peroxidase-hydrogen donor system with acetic acid prior removal by treating with copper or iron ions

IATRON LABORATORIES 29.06.79-JP-081301
 B02 J04 (27.08.81) *J56008-699 C12q-01/62
 29.06.79 as 081301 (5NS)

Determination of uric acid in serum using the reaction system of uricase-peroxidase-hydrogen donator is characterised by the prior removal of ascorbic acid from serum by treating it with Cu(++) and Fe(++) ion.

Uric acid determ. is used for diagnosing podagra, etc. Reducing substances present in serum e.g. ascorbic acid, etc. compete with hydrogen donator and cause determ. error. In an example, the test sample was added to the buffer soln. of pH 3-5 contg. Cu(++) ion 0.2-0.5 mmol/l and Fe(++) ion 0.02-0.06 mmol/l and the ascorbic acid in the sample was oxidised to dihydroacetic acid with Cu(++) ion. The formed hydrogen peroxide was reduced by Fe(++) ion. The inhibiting effect of Cu(++) ion and Fe(++) ion on enzymes was avoided by use of EDTA.

Ascorbic acid is removed and uric acid can be determined more exactly. (J56008699) (5pp)

KURS D16 32862 X/18 = J8 1036-979
Reactive carrier for amino acid, enzymes etc - is silylated and treated with polymer having nitro benzene pyridinium radicals

KURARAY KK 11.09.74-JP-104561

5.02.77 as 015277 (43DJ)

Multiomycin (I) is prepd. by culturing (I) bacterium on a culture
medium contg. 3-12% cotton seed powder and adjusted to pH 4.0-
8.

The process increases the prodn. rate of Multiomycin by
culturing Streptomyces S.P. 8446-CCl (applcn. no. 3284) on a
culture medium composed basically of those used for culture of
Actinomyces and added with cotton seed powder as nitrogen
source and pH 4-8, pref. in the form of liq. medium, in aerobic
conditions, at 10-50 deg. C for 1-8 days.

The process produces (I) on an industrial scale. (J53101593)
(pp)

JOJK D16 13737 Y/08 = J8 1037-798
Gel-formable yeast protein prepn. - by extraction of yeast bodies
with dilute alkali soln., neutralisation and heat treating
KOHJIN KK 25.06.75-JP-077523
(D13) (02.09.81) *J52003-896 A23j-01/18 + C12p-21
5.06.75 as 077523 (5BL)

The yeast bodies (e.g. pulp waste yeast, bread yeast, yeast
obtained from acetic acid, etc.) are extracted with the alkali soln.
at room temp. or with heating, the extract is neutralised after
drying, and the yeast proteins obtd. are heat treated at 60-100
(30-80) deg. C with hydrophilic organic solvent.

This process allows removal of solubles, including lipids and
low molecular components, from yeast proteins and making
yeast proteins high molecular substance. It can be practiced
easily and simultaneously, and sufficient water-holding property
and gel-forming property are given to the yeast proteins. This
process can be adapted for industrial use. (J52003896) (4pp)

NOVO ★ D16 D/39 ★ SE 8100-713
Ethanol prodn. from aq. suspension of granular starch - by
fermentation in presence of alpha-amylase or glucoamylase (BR
8.8.81)
NOVO INDUSTRIES 06.02.80-US-119034

30.01.81 as 000713 (903WB)

Ethanol prodn. is carried out using an aq. suspension of starch
granules in the presence of alpha-amylase or glucoamylase. The
concn. of dissolved sugar is almost zero under the fermentation
conditions. The enzyme may be recovered for re-use.

PETR D16 20101 Y/12 = SU -791-769
Antiwear additive esp. for diesel and aircraft turbine fuels -
consisting of biolipid extract from microbial processing of
hydrocarbons
VEB PETROCHEM SCHWEDT (BOHL) 16.12.75-DD-190166
(31.10.75-DD-189162)
H06 (01.01.81) *DD-123-811 C101-01/26
13.10.76 as 409353 (GW)

Antiwear additive for mineral oil prods. consists of the biolipid
extract from microbial processing of hydrocarbons. It is added in
amts. of 0.001-0.1 (0.001-0.05)%.

Wear of components, e.g. injection pumps, is reduced without
adversely affecting other properties, e.g. thermal stability or
emulsification in water, and without increasing the N or S
content. In an example, addn. of 0.05% biolipid extract to a
refined diesel fuel increases its Alman-Wiel and break load from
180 + -50 to 320 + -50 kp. Bul. 48/30.12.80. (2pp)

MOSU ★ D16 71163 D/39 ★ SU -791-771
Determining recoverability of adenosine triphosphate from soil -
includes treating soil with known amt. of adenosine
tri:phosphate, re-extn. and luciferin luciferase reaction
MOSCOW LOMONOSOV UNIV 10.10.78-SU-672645
(30.12.80) C12n-01 C12q-01
10.10.78 as 672645 (70VE)

Amt. of adenosine triphosphate recoverable from soil after
introduction of a sample of an adenosine triphosphate-contg.
substance into the soil is determined by extn. followed by the
luciferin- luciferase reaction effected in the extract.

The accuracy of this method is increased by using a sample of a
lyophilised microorganism culture contg. a known amt. of
adenosine triphosphate. The sample is admixed to the soil and
treated with boiling water for 1-2 sec. (2pp)

KURE D16 79384 A/44 = SU -793-408
Increasing antibiotic activity against resistant bacteria - using a
nitrogen-contg. polysaccharide extracted from Coriolus
mycelium

The sensitivity of resistant bacteria to antibiotics is increased
using an N-contg. polysaccharide (I) which can be obtd. by
extracting the mycelium of a basidiomycete of the genus Coriolus
(family Polyporaceae) with an aq. solvent and working up the
extract. (I) has a mol. wt. of 500-300000 contains 42.0-46.0% C, 5.3-
7.0% H and 0.5-8.0% N, has a specific rotation between 0 and +50
degrees. is readily soluble in H2O but insoluble in acetone,
pyridine, CHCl3 and hexane, and has characteristic IR
absorption bands as ca. 840 and 890 cm. to minus one.

(I) can be administered in association with a wide range of
antibiotics (e.g. penicillins, cephalosporins, tetracyclines,
streptomycin, kanamycin and chloramphenicol) to increase the
strength and duration of their activity against various resistant
strains of e.g. Staph. aureus, E. Coli, Sain enteritidis, K.
pneumoniae, Shigella sonnei, Ps.aeruginosa Strept.faecalis,
Proteus mirabilis and Enterobacter aerogenes. Bul. 48/30.12.80.

Test for immunological reaction of animal cells - includes
culturing test cells with antigen in horizontal and inclined slotted
chambers

ROST MED INST 11.09.78-SU-662956
B04 S03 P31 (S05) (12.02.81) A61b-10 G01n-33/16
11.09.78 as 662956 (938GW)

Animal cells concerned in body immunity to infections, e.g.
whooping cough infection, are incubated with corresp. antigen,
e.g. whooping cough antigen, and the treated cells migration is
evaluated to estimate cell's immunological reaction. The method
of the estimation is simplified if the test cells are incubated for 1-6
hrs. in slotted cultivation chambers with slots in horizontal plane
followed by the 1.8 hrs. cultivation with slots inclined at 10-15 deg.
angle. The cell's immunological reaction to the presence of the
antigen is then evaluated by difference in the length of cell's
layer formation. Bul. 1/7.1.81. (2pp)

VOTE = ★ D16 71269 D/39 ★ SU -793-645
Appts. for washing and disinfecting grain - in which grain is
treated twice with fresh water and compressed air, and after
removing unwanted impurities is washed with disinfectant
VORON TECH INST 05.03.79-SU-733736
P41 (12.02.81) B02b-01/06
05.03.79 as 733736 (29GW)

Appts. for washing and disinfecting grain is used in the prodn. of
alcohol, alcohol-free drinks, and glucose. It has horizontal
chamber (1) divided by a vertical partition into two chambers

(2,3), i.e. washing and water-sepn. sections. The chamber has a lid, pipe to supply the grain (8) together with the treatment soln. plus an attachment to mix the grain, discharge it, and also separate the mud. The quality of the final grain is increased, as a result of intensifying the friction, by dividing the washing chamber (3) with an extra partition into two parts. The attachments for mixing the grain are fastened to the partition, and are as pipes which are semicircular in cross-section. Tubes are connected to the lid for feeding in compressed air. The water-sepn. section (4) has guiding shelves at an angle of 50-60 deg. to the horizontal, and made 2/3rds of their length with perforations. Bul. 1/7.1.81. (3pp Dwg. No. 3)

 Selective pituitary gland hormone prodn. - by serial sec. suspension culture of pituitary tissue in amino acid medium contg. liver extract, insulin, antibiotics and hormone

UNIV OF CALIFORNIA 06.11.78-US-957725 (09.04.76-US-675643)

B04 (08.09.81) A01n-01/02 C12n-05/02 C12p-21/02

06.11.78 as 957725 C.i.p 4124448 (916BZ)

Nutrient medium for the serial subculture of pituitary gland cells consists of amino acid rich nutrient Medium 199-1X with Earle's modified salts, 5 to 20 ml liver extract, 6 to 20 IU insulin and minor amounts of antibacterial and antifungal agents. The culture produces prolactin when it additionally contains 10 to 100 mg/l medium 199-1X of a progesterone-androgenic substance and prolactin and lutenizing hormone (LH) when 5 to 40 mg/l of an estrogenic substance is present.

Hormones produced in this way are cheaper than those extracted directly from a natural source. When pituitary cells are cultured without the additives, a whole range of hormones are produced including LH and prolactin, but the additives stimulate the production one or two hormones over all the others. (5pp)

Alcohol prodn. from grain by degermination - sepn. into starch-protein and germ-hull fractions, enzymatic saccharification of starch and fermentation of sugar mash obtd.

PROCESS ENG CO 27.08.80-ZA-005297
C03 E17 (D13 E36) (10.07.81) C12c

27.08.80 as 005297 (NS)

Grain is subjected to degermination, pref. to dry-degermination and separated into a start-protein fraction and a germ-hull (skin) fraction.

The start fraction is subjected to enzymatic saccharification, the proteins removed from the resulting sugar mash and the mash is fermented to alcohol.

Oils are removed from the germ-hull fraction by solvent extr. and the residue converted into a protein-contg. animal feed. Carbon dioxide (CO₂) and methane gas are obtained as byproducts. (16pp)

Prod. of hydrocarbyl aldoses is carried out by forcing a slurry of carbohydrate, monohydric alcohol and acid catalyst continuously through a heated tubular reactor, and recovering at least one aldose from the reactor effluent.

The reaction is pref. effected at 100-400 (esp. 160-180) deg.C in a reactor with a length of at least 50 ft and an inside dia. of 0.18-6.0 inch. The MeOH/starch molar ratio in the feed slurry is pref. 6.5-5:1 and the catalyst concn. is pref. 0.1-10 mole % (based on dry starch solids). Suitable catalysts are HCl, H₂SO₄, H₃PO₄ and organosulphonic acids. The effluent is pref. flash cooled as it leaves the reactor, concd. to 40-80% solids, and (I) crystd. out at 5-10 deg.C. The mother liquor is pref. recycled to the reactor together with make-up starch and MeOH.

The process is esp. useful for producing methyl alpha-D-glucopyranoside (I) from starch and MeOH, (I) being useful as an intermediate for surfactants, glycoside polyols, etc. Products contg. at least 45 wt.% (I) can be obtained in high space-time yields. (43pp)

Continuous acid hydrolysis of cellulosic vegetable material - for prodn. of sugar for fermentation to alcohol
REITTER F J 23.02.80-DE-006887
(D16) (16.09.81) *WP8102-428 C13k-01/02
21.02.81 as 101260 (513BZ) (G) WP7900119 DE2324022 US4025356 US1677406 E(AT BE CH DE FR GB IT LI NL SE)

Process is claimed for continuous hydrolysis of pentosan-contg. hemicelluloses, cellulose, and similar cpds. in vegetable biomaterial into sugars. The comminuted raw material is treated in a first stage in the presence of dil. acid under conditions of temp. and press. such that the hemicelluloses and only part of the cellulose are hydrolysed during a first period of pentoses and partially hexoses. The reaction mixt. is then suddenly released and the hydrolysate is sepd. from the biomaterial. The cellulose in the biomaterial is then hydrolysed to hexoses in a second stage

with dil. mineral acid under more rigorous condition of temp. and press., after which the press. is again suddenly released and the residual biomaterial is sepd. from the hydrolysate.

The biomaterial is fed into the pressure reaction chambers by means of a screw feed which acts as a pressure seal and in which air and excess moisture in the biomaterial are largely removed. Hydrolysis is carried out in a continuous horizontal cooker in the vapour phase. The neutralised hydrolysate is recovered in several sepn. stages and further processed to recover the sugars.

Process can be used with a wide range of cellulosic raw material including voluminous materials such as annula plant residues, waste paper etc. which cannot be used in percolation type cookers. The sugars obtd. can be fermented to form alcohols, which are useful as a fuel additive. (44pp)

 Glucose isomerisation to fructose with immobilised enzyme after treatment with ion exchanger in sulphite form
STANDARD BRANDS INC 15.11.79-US-094520
E13 (D16) (08.09.81) *BE-886-199 C12p-19/24
 15.11.79 as 094520 (931NS)

Glucose is enzymatically isomerised in an ion exchange refined glucose-contg. liquor to fructose by treating with an ion exchange material in the bisulphite/sulphide form; and contacting the treated liquid with immobilised glucose isomerase under isomerising conditions to convert part of the glucose to fructose. Pref. the ion exchange resin is a weak- or storage-base anion exchange resin in the bisulphite/sulphite form. The pH of the liquor treated is 1.0-8.0 (pref. 3.5-6.5), and the temp. of the treatment 25-70 deg. C (pref. 50-65 deg. C).

The process increases the stability or effective life of the enzyme used. (6pp)

COKE ★ D17 71682 D/39 ★ US 4288-551
 Purification of sugar syrups by prim. flock flotation - then decomposition of hydrogen peroxide with catalase to form oxygen bubbles, then sec. flock flotation
COCA-COLA CO 10.03.80-US-128683
(08.09.81) C12p-03 C13d-03
 10.03.80 as 128683 (478BZ)

Impure sugar (I) syrups are purified as follows: (a) the (I) syrup is kept at not above 73 deg. C. but not below the temp. at which prim. floc formation would proceed to completion; (b) syrup is mixed with not less than 25 ppm by vol. H2O2 and a prim. floc-forming chemical couple (amt. to form a prim. floc which captures most of the impurities in the impure syrup); (c) catalase (II) is added in an amt. sufficient to cause rapid decompsn. of the H2O2 (with rapid generation of O2 bubbles); (d) a polyelectrolyte (III) is dispersed in the syrup with agitation (within 180 sec. of mixing in step (c)) to form a sec. floc which contains enough entrapped O2 bubbles to cause flotation of the floc; (e) the agitation is stopped within 180 sec. (f) flotation of the sec. floc proceeds to afford a purified (I) syrup; and (g) the purified (I) syrup is sepd. from the sec. floc.

The floc flotation process is very rapid, avoids the capital expense and power costs associated with conventional aeration, and allows the use of O2 bubbles generated from H2O2 and (II). (15pp)

04.02.81 as 400170 (395RH) (F) No-Citns. E(BE CH DE GB IT LI NL)

Compsn. for prevention of hair loss and to encourage regrowth comprises an alcoholic soln. contg. a turpentine alcoholate, tincture of Arnica, ginseng extract and a chondroitin salt or cartilage mucopolysaccharides.

Compsn. which stimulates the blood circulation in the scalp, avoiding loss of hair and encouraging regrowth of hair in bald areas. The compsn. controls seborrhea and is non-toxic and non-irritant.

Compsn. pref. also contains tincture of cinchoma, a perfume chosen from eau de Cologne, oil of lavender and oil of lemon and D-panthenol. The alcoholic excipient is usually 65-75 deg. ethanol. The ginseng is usually in the form of a glycolic extract contg. 1% saponins or an aq. alcoholic extract contg. 5-10% of saponins. The chondroitin salt is pref. the sulphate. The compsn. may also contain biotin (or vitamin H), tocopherol (or vitamin E), cystine, cysteine or an extract or tincture of cress. (7pp)

UNIL ★ D21 70314 D/39 ★GB 1598-567
Hair conditioner contg. volatile silicone - and water soluble or dispersible fluorinated surfactant

UNILEVER NV 18.04.77-GB-015968

A96 E19 (A26) (23.09.81) A61k-07/06

18.04.78 as ----- (1302PW)

Hair conditioner contains a volatile silicone of boiling point 99-265 deg.C and a water soluble or dispersible fluorinated surfactant. The surfactant has the formula RFX, RFR'X, RFArX, RFR'(C2H4O)nX (I) where n=0-6, RFSO2NR2, RFSO2NR'X, RFSO2NR'R'N+R2R'X, RFSO2NR'R'NR2, RFSO2NR'R'NR3Y-, RFSO2NR'R' (C2H4O)nOH where n=0-16, RFSO2NR(C2H4O)nH where n=0-10, RFCONRR'NR2, RFCONRR'N+R3Y-, RFCONRR'N+R2R'X, (RFR')2X, RFR'S(CH2)nX or RFR'OCO(CH2)nCH3 where n=1-20 or a glycerol triester of RFR'OCO-. RF is a 6-22C wholly or partly fluorine substd. alkyl or alkenyl gp. R is H or 1-7C alkyl. R' is 1-7C alkylene. Ar is a mono- or di-nuclear aromatic residue. X is a carboxylic, phosphoric or sulphonic acid, amide, ester or salt gp. or an OH gp. Y is an anion.

The conditioner gives ease of wet combing and leaves no fatty residues and makes the hair surface grease repellent. (8pp)

KANE ★ D21 70354 D/39 ★ GB 2071-494
table, clear, non-gelling liq. skin cosmetic compsn. - comprising water, oil substance (e.g. perfume, hormone) and 18-alpha-glycyrrhizin cpd. as solubilising agent

KANEBO KK(MAZN) 02.10.80-JP-138512 (08.03.80-JP-029608)
E13 (23.09.81) A61k-07/48
03.03.81 as 008597 (914AT)

A clear liq. skin cosmetic compsn. consists of a solubilising agent, an oily substance and water, where the solubilising agent is one or more 18-alpha-glycyrrhizin of formula (I), or a mixt. of 10-98 mole% (I) and 2-70 mole% of a corresp. 18-beta-glycyrrhizin (II). A and A' are H, Na, K or NH₄. (I) or the (I)/(II) mixt., dissolves rapidly in water to give a clear soln. which is not subject to viscosity build-up or gelation even if its pH value is in the acidic range (c.f. prior art use of (II) alone). Oily substances can be dissolved in the resulting soln. without the need to use a solubilising assistant. The resulting compsn. has good fluidity and is easy to apply to the skin surface to provide beneficial cosmetic or medicinal effects while giving a non-irritating, non-greasy, smooth feeling. The compsn. may be a cleansing lotion, acidic skin conditioning lotion, astringent lotion, after-shave lotion, sunscreen lotion, calamine lotion, aq. make-up base, antiphlogistic lotion (I and II exert an antiphlogistic action) or a lotion for applying oil-soluble medicines such as vitamins or steroid hormones. (16pp)

LOREAL ★ D21 70355 D/39 ★ GB 2071-495
Two/phase compsn. for skin or hair - contg. oily phase, with aq. phase contg. dissolved cationic polymer(s)

L'OREAL SA 18.03.80-FR-005985
A96 (23.09.81) A61k-07/06

17.03.81 as 108307 (478RP)

Two-phase liq. compsn. for application to skin or hair consists of (a) an oily phase; and (b) an aq. phase contg. 1 or more dissolved cationic polymers (I).

The oily phase pref. contains 25-100% by vol. vegetable oil, together with 0-75% by vol. conventional animal, synthetic, and/or mineral oils, but pref. no silicone oil. Opt. the phase may also contain antioxidants, colourants, and/or perfumes, and opt. also 0-3% by wt. of a cosmetic cationic surfactant. Aq. phase is 2-50% by vol. of total compsn. contains 0.2-50% by wt. (of total compsn.) of (I), and may also contain (up to total 50% by vol. of aq. phase) of preservatives, thickeners, colourants, and/or H₂O-soluble solvents.

The compsn. contains no detergent or foaming agent but combines the cosmetic effects of a variety of oils and (I). Compsns. are useful for the treatment of dry or sensitised hair, or dry, wrinkled or rough skin, etc. (8pp)

NISW ★ D21 70560 D/39 ★ J5 6099-405
Cosmetic contg. tomato oil - which contains linolic acid vitamin/E, does not stimulate skin

NISSHIN OIL MILLS KK 10.01.80-JP-000938
(10.08.81) A61k-07

10.01.80 as 000978 (5RH)

Cosmetic contains tomato oil. Tomato oil contains large amount of linolic acid and vitamin E and is not stimulative to skin. The cosmetic has excellent spreading properties and feel in use. Further tomato oil can be extracted from the seed of tomato and the lees which are discarded on squeezing tomato juice and have been used as the feed for cattles.

Tomato oil can be obtained by extracting whole tomato, tomato lees or tomato seed with organic such as petroleum ether, hexane, benzene, toluene, xylene, etc.,. Containing carotinoid pigments the extract is often coloured red and it can be refined and decolourised by treating it with activated clay, active carbon, etc. and steam-distilling it. Cosmetic pref. contain 3-12 wt.% tomato oil. (3pp)

TOGA- ★ D21 70561 D/39 ★ J5 6099-406
Hair dressing compsn. - contains human hair pulverised at its brittle temp. and opt. keratin extract

TOHO GAS KK(ICH-OSAG-) 11.01.80-JP-002341
(10.08.81) A61k-07/06

11.01.80 as 002341 (5BZ)

Compsn. of either (a) the human hair pulverised in the atmos. of below -100 deg.C or (b) the keratin extracted from the human hair powder is used in hair-dressing agent.

Hair-dressing compsn. shows good humidity-holding effect and good revivifying effect on hair and makes hair soft, emollient, elastic and glossy.

The proteins obtd. from animals such as collagen, gelatin, keratin, that are combined in hair cosmetics often have caused allergies. Human hair pulverised at below its brittle temp. is excellent for hair-dressing compsn. The human hair powder has the similar structure as cortex fibre cells inside of human hair and by spreading it on hair shows revivifying effect on the hair damaged by cold-waving, hair dye, etc. (5pp)

NIPQ ★ D21 70712 D/39 ★ J5 6100-384
Teeth brushing time indicating aid - consists of compsn. which contains component which has reversible colour change on oxidn.-redn.

DAINIPPON PRINTING KK 16.01.80-JP-002651

E24 (12.08.81) A231-01 C09k-03 G04f-13

16.01.80 as 002651 (50DH)

A composition having the function of displaying passed time which comprises containing a colouring material which changes reversibly its colour by oxidation-reduction reaction (e.g. Safranin T, phenosafranin, methylene blue, thiazine dye, etc.) and reducing substance (e.g. substance capable of reducing the colouring material, such as glucose, ascorbic acid, sodium hydrosulphite, etc.) as essential components. The compsn. is used in the form of powder, tablet, printed form, etc. The amount of reducing agent used is pref. 0.1-100 wt. pts. per 1 wt.pt. of colouring material.

As the reduced colouring material exhibiting a reduced colour is easily oxidised by oxygen in the air to return the original oxidised colour and the rate of returning the original oxidised colour differs depending on the oxidation-reduction potential of each colouring material, the lapsed time can be simply and visibly judged by a distinct colour change of the compsn. When the compsn. is mixed into tooth paste, the time of brushing teeth with the paste can be easily seen from the colour change of the paste. (3pp)

KANE- ★ D21 70770 D/39 ★ J5 6100-709
Photochromic nail varnish - contg. film-forming agent and spiro-pyran cpd

KANEBO KESHOHIN KK(NIKA-) 16.01.80-JP-003823

A96 E01 (12.08.81) A61k-07/04

16.01.80 as 003823 (5WB)

Nail varnish contains (a) film-forming agent and (b) spiro-pyran cpd. (I) or photochromic material contg. (I) as major ingredient.

R1 is alkyl. R2 and R3 are alkyl, hydroxyalkyl, alkoxyalkyl or cycloalkyl formed from R2 and R3 together. R4 is alkyl. R5 and R6 are H, alkyl, alkoxyalkyl, dialkylaminomethyl, nitro, halogen or alkoxy. Proviso is that at least one of R5 and R6 should be nitro. n is 1-2.

The varnish is extremely stable and does not discolour nails. (6pp)

GCSH- D21 61075 A/34 = J8 1037-184
High strength dental gypsum - comprises alpha-calcined gypsum, water-soluble triazine-series high condensate and water-soluble inorganic magnesium salt

SHIKAGCKO GYO KK 28.12.76-JP-157383

B07 P34 (28.08.81) A61l

13.05.81 as 888786 (448KB)

The applicator comprises a flat backing strip of fairly rigid material e.g. a composite laminate of aluminium foil and cardboard. An absorbent pad is fixed centrally on the strip which has a fold line on each side of the pad. This allows the extending wing of backing strip on each side of the pad to be bent back away from the pad to meet the wing bent back from the other side.

Near the end of each, a transvers fold line allows the extremities of the wings to be made parallel to each other and at 90 deg. to the original plane of the backing strip. These extremities provide a thumb and finger grip at the apex of a triangular structure formed by the wings extending from the strip section which backs the pad.

The pad is pref. impregnated with a medicament, partic. a disinfectant, and covered by a tear-off cover which is sealed by its edges to the backing strip. The backing strip can be a sheet of

28.11.79 as 947985 (280AT)

New biodestructive material for use as a joining element for bone tissue is a matrix of (A) a non-toxic resorbable polymer consisting of hydrophilic and hydrophobic members and (B) a reinforcing component made up of non-toxic, resorbable fibres.

The polymer component of the matrix pref. contains 20-40wt.% hydrophilic monomer. Pref. hydrophilic monomers are N-vinylpyrrolidone and acrylamide. Pref. hydrophobic components of the polymer are alkyl acrylates, esp. methyl methacrylate. The reinforcing fibre (pref. constituting 50-80wt.% of the matrix.) pref. consists of filaments of polyamide, oxycellulose and/or polyvinyl alcohol.

Used in the form of rods, clamps, plates etc. for fixing bones after fractures etc. The new material facilitates fixing of fractured bones, but is gradually absorbed so that surgical

removal is not necessary. The material is easily worked, so that the shape and size of the fixing elements can be tailored to the individual case. (13pp)

Bottle screw cap steriliser - by hot air jet monitored for neither excessive nor inadequate sterilising temp.

NOLL MASCH GMBH 11.03.80-DE-009202

X25 Q39 (D14) (17.09.81) B67b-01/02 B67b-03/20

11.03.80 as 009202 (39RH)

The screw caps of a bottling machine are sterilised as they slide down an inclined chute by a jet of hot air (400 deg.C) which heats all parts including the sealing washer at the bottom to 220 deg.C. A sensor monitors the flow of screw caps and if there is an interruption, it passes a signal to a power cylinder which swivels the nozzle with the electric heater and blower unit away from the chute.

Another sensor on the bottling machine swivels the jet when the machine drive stops. A third sensor monitors the hot air flow and stops the machine if this fails or its temp. drops too much.

This ensures that the screw caps are neither damaged by excessive heat nor sterilised inadequately. (9pp)

Carbon as implantable carrier for antibiotics - e.g. in joint prostheses

SIGRIELEKTROGRAPHI GMBH 01.03.80-DE-007878
B06 E36 P34 (B07) (16.09.81) *DE3007-878 + A61k-09/20
13.11.80 as 107003 (280NS) (G) No-Citns. E(AT CH FR GB LI)

Use of carbon as an implantable carrier for antibiotics is new.

The carbon carrier may be in the form of a prosthesis (e.g. a hip joint prosthesis) or an implant intended solely as an antibiotic carrier. In the latter case, the carbon is pref. of a highly porous kind which can be changed with antibiotic by immersion in an antibiotic soln. In the case of prosthetic implants, mechanically less stressed parts of the prosthesis may be more porous in order to accommodate the antibiotic. Carbon carriers contg. antibiotics may also be used in direct contact with bone cement. Suitable forms of carrier are carbon fibres of carbon granules embedded in bone cement.

Carbon implants are biocompatible, and carbon does not adversely effect the activity of antibiotics. The antibiotics are desorbed from the carrier surface relatively slowly, so that their effect is prolonged. (6pp)

18.02.81 as 005073 (476AT)

Hydroxyalkyl-piperidine derivs. of formula (I) are new. x is 0 or 1; R1 is 5-20C alkyl or is aryl substd. by at least one electron-withdrawing substit; R2, R5 and R6 are each H, 1-20C alkyl or aryl substd. as for R1; R3 is H or 1-6C alkyl; R7 and R8 are each H or together are -CH(R4)- in which R4 is H, 1-16C alkyl or aryl substd. as for R1. Also new are cpds. of formula (I) in which x is 2, R1, R2, R5 and R6 are each H, 1-20C alkyl or aryl; R3 is as previously defined; and R7 and R8 are as previously defined except that when R4 is aryl it may be unsubst., but excluding the cpds. in which x is 2, R1, R2, R5 and R6 are each H, R7 and R8 are each H or together are methylene, and R3 is H, methyl or ethyl.

Cpds. (I) as widely defined, have fungicidal algicidal and barnicidal activity. Because of their low seawater solubility they have increased useful life and reduced toxic effects away from the treated surface. They are simple and inexpensive to prepare and are generally colourless. In tests on the early stage nauplic of *Elminius modestus* and *Balanus balanoides*, many cpds. (I) exhibit 100% toxicity at a concn. of 10 power minus 5 g/ml. In addn. to their use against undesirable biological growth on submerged, partly submerged or damp exposed structures e.g. in paints, (I) may also be used against fungal growth in hydrocarbon fuels. (17pp)

Solid perfume mfr. - by mixing tri:chloro:methylphenyl carbinol acetate, yellow wax and silica, adding perfume, heating, cooling and moulding

MUSASHINO KORYO KAG 21.01.80-JP-004628

E14 P34 (D21) (15.08.81) A611-09/★

21.01.80 as 004628 (117WB)

A base material trichlormethylphenylcarbinol acetate is mixed with 5 to 20% (on base material) yellow wax and then with 20 to 50% (on base material) SiO₂, perfume is added to it and the resultant mixed by heating, cooled, and moulded.

The solid perfume has excellent mechanical strength, dimensional stability, etc., and long lasting perfuming effect. The solid can contain a high concn. (up to 40%) of perfume and also can be used stably even at the high temp. ca. 40 deg. C for more than 90 days. The solid perfume is useful in rooms or for humans.

For example, 36 pts. trichloro methylphenyl carbinol acetate, 4 pts. yellow wax, 20 pts. SiO₂, and 40 pts. jasmine perfume were mixed by heating, cast in a mould, and then cooled. (2pp)

Adsorbent material comprising alkyd resin and melamine resin - produced by coating support e.g. aluminium plate with the resin materials soln. and curing

TOYO INK MFG KK 23.06.76-JP-073315

A97 J01 (A21 A23) (02.09.81) *J52156-792 C11b-03/10 + B01j-20/26 C02f-01/28 C07c-07/12

23.06.76 as 073315 (43BL)

Adsorbing material comprises alkyl-melamine resin the wt. ratio of alkyd resin:melamine resin being 1:9 to 9:1. The adsorbent is in the form of porous material, supported by glass beads, styrene beads, aluminium plate, steel plate galvanised with tin, chromated steel plate and stainless steel plate, and is produced by coating the surface of the support with a soln. of alkyd melamine resin and effecting a curing thereof.

The alkyd resins are e.g. those from polybasic acids, oils and fatty acids, and polyhydric alcohols, having acid value 3-6, oil length 30-40% and M.W. 3000-6000. The melamine resins are e.g. butylated melamine or a condensn. prod. of butylated melamine and benzoguanamine, having a butylation degree 1.5-2 and M.W. 1200-2000. Curing is effected for 8-15 min. at 170-220 deg. C

The adsorbing material can adsorb ordinary substances and

those with M.W. less than 600, and has improved adsorption in the presence of water, and desorbs easily by contacting with n-butanol, n-pentane, nitrogengas, etc. It is used directly for removal of lower M.W. cpds. e.g. from waste water, and is applied on the inner side of the vessels to form adsorbent to purify fats and oils by removing free fatty acids, etc. (J52156792) (3pp)

10.01.80 as 001961 (126AS)

At least 1 straight or branched chain alkylbenzene sulphononic acid is added to at least 1 fatty acid. Monobutylether, monoethylether and/or monomethylether of ethylene glycol is/are added, followed by heating. Prod. is saponified with soluble alkali and neutralised. Anionic, nonionic and/or amphoteric surface active agent is added. (M)ethyl alcohol and/or other alcohol, together with sodium meta silicate, at least 1 other silicate or Glauber salt.

Generation of acidic soap is retarded. The dil. soln. of the detergent is prevented from becoming turbid and decrease in detergency due to the formation of acidic soap is avoided. Generation of coarse particles of the metallic soap is prevented. Since no P cpd. is used, there is no danger of causing eutrophication or other pollution. (5pp)

A dish-washing and cleaning compsn. for manual washing of dishes consists of (a) 20-90 (80-90) wt.% of an alkane sulphonate, alkene sulphonate, alpha-sulpho-fatty acid ester, sulpho-succinic acid ester, alkylbenzene sulphonate or alkyl sulphate with chain length 8-20C, and (b) 80-10% of a sulphated conversion prod. of a 6-22C sec. alcohol with 1-30 mols. of propylene oxide and/or ethylene oxide.

(a) 10-20C Alkene sulphonates, and alkylbenzene sulphonates with chain length 10-14C are claimed. The sulphonates are pref. used as alkali metal, ammonium or amine salts. (b) Sulphated conversion prods. of 10-18C sec. alcohols alkoxyated with 1-6 mols. of propylene oxide and/or ethylene oxide are claimed.

The cleaning powder of the compsn. is higher than that of (a) alone. The compsn. can also be used to clean tiles, table surfaces and metal covers. (7pp)

Soiled textiles are washed by adding a washing agent consisting of two components (I) and (II) to an aq. washing liquor contg. the textiles so that the total amt. of all active washing ingredients is 2-8 gm/litre of wash liquor, agitating the textiles, draining and rinsing the textiles.

(I) is an aq. dispersion of 15-35 wt.% 12-18C fatty acids contg. 60-100% oleic acid, 2-6 wt.% KOH and 2-6 wt.% triethanolamine, the total being such that 50-95 wt.% of the acids are present as the soap, 4-10 wt.% of an ethoxylate, 4-10 wt.% of Na 10-14C alkylbenzenesulphonate, 0.05-1 wt.% of an alkali metal salt of substd. stilbenesulphonic acid optical brighteners, 5-15 wt.% of an alcohol and 35-50 wt.% water.

(II) is an aq. soln. of 5-12 wt.% Na and K tripolyphosphate, 0.5-4 wt.% 1-hydroxyethane-1,1-diphosphonic acid Na or K salt, 10-20 wt.% Na and K hydroxide, 0.5-3.5 wt.% alkali metal silicate, 0.2-5 wt.% sequestering agent and 50-70 wt.% water. Detergent has

sudsing rate. (7pp)

In cleaning a car by washing using soapy water, prerinsing, final rinsing and drying by air stream, improvement comprises (1) mixing the prerinse water before use with a surface-tension increasing agent (I) to make car surfaces slightly hydrophobic; and (2) pouring the rinse water over car from overhead dispenser at atmos. pressure as a continuous film, the film running off the car without leaving drops behind. The dispenser has a downwardly extending curtain formed by filaments which contact the car at their lower edges, the rinse water being poured down the filaments.

Pref. prerinse water is aq. alcohol soln. in concn. of 0.2-0.5 wt.%. Pref. (I) comprises by wt. 5-15% dialkyldimethylammonium chloride with 12-16C; 4-10% of mixt. of prim., sec. and tert 6-12C amines; 8-20 wt.% solvent; 2-5% defoaming oil; and 1-5% scent.

Method permits use of a lower capacity drying blower. (5pp)

Arrangement of Abstracts

'MAJOR' COUNTRIES – An alerting abstract of every basic document is provided, and of examined equivalents from West Germany, Great Britain, Japan, the Netherlands and the United States, and granted and unexamined European and unexamined PCT equivalents. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

D1: FOOD; FERMENTATION

D11: BAKING

DEBA- ★ D11 71940 D/40 ★DE 3009-890
Baking oven - with convergent-divergent slots in top of centre partition in each deck

DEBAG DEUTSCHE BACK 14.03.80-DE-009890
(24.09.81) A21b-01/24 A21b-03
14.03.80 as 009890 (39BZ)

A baking oven has several decks of baking chambers. The baking chambers are subdivided by vertical partitions, parallel to the side walls with the alternate hot air supply and discharge ducts. A horizontal slot is left between the top of each partition and the ceiling for next higher deck. Guide plates on both sides of each slot are inclined downward and define a convergent-divergent cross-section for each slot.

This makes it possible to increase production by wider decks, yet it prevents direct contact of the dough by the main hot air stream. The result is a uniform browning of the bread crust without excessive burn marks. (19pp)

FATT- ★ D11 72024 D/40 ★DE 3030-757
Automatic dough ring laying machine - with gyrating nozzle tubes and cut/off press-down blade

SOC FATTO FOLLI GIU 14.03.80-IT-003353
(24.09.81) A21c-03/10
14.08.80 as 030757 (39RP)

A machine to produce rings of dough for pastry has several (four) tubes which are directed downward on a moving belt conveyor. The tubes are hinged at the bottom and are driven so that their nozzle ends describe circles. A blade on a parallelogram linkage cuts off the strands and is moved down to compress the overlapping ends.

This is a simple design which is easy to maintain. It combines a high productivity with good functional reliability. (30pp)

FIND- ★ D11 72061 D/40 ★EP --36-088
Machine to roll up pancakes, croissants, meat rolls etc. - uses horizontal spaced conveyor cables intersected obliquely by second set of cables

PRODUITS FINDUS SA 06.03.80-SE-001770
(23.09.81) A21c-03/06 A21c-09/06

18.02.81 as 101139 (448DH) (F) No-Citns. E(AT BE CH DE FR GB LI)

The machine comprises a horizontal conveyor band made up of a number of parallel, spaced, individual belts, cables or ropes. A second conveyor band, similarly constructed of individual belts, intersects the first band, the belts of the second band passing through gaps between belts of the first band, and vice versa.

In plan view, the line of intersection extends obliquely, but only partly, across the horizontal band. For thicker prods. such as meat roll and croissants, a third band can be disposed to intersect the first two so that rolling is accomplished in two stages. The belts are pref. cables or wire ropes each with a dia. of about 5mm and spaced from each other by about 15mm.

High productivity from a simple, inexpensive, compact machine which is readily adjustable and easy to maintain. (16pp)

LENC/ ★ D11 72210 D/40 ★FR 2476-443
Tool for cutting paste blanks for pizzas art bases etc. - uses air pump to suck blank into tool and then de mould by blowing

LENCOT G 22.02.80-FR-004136
(28.08.81) A21c-11 A21d-08

22.02.80 as 004136 (448PW)

The tool is in the form of an inverted basin of which the profiled edge cuts through the sheet. The tool is placed, edge downwards upon the sheet of pastry. The chamber now enclosed between tool and pastry is connected temporarily to a vacuum pressure. This pulls the pastry sheet sharply against the cutting edge of the tool, a cutout blank being drawn upwards into the tool chamber. The chamber is then connected to a source of compressed air which cleanly demoulds the blank. Cutting and demoulding pressures in the tool chamber are pref. obtained by connecting the chamber first to the suction side and then the delivery side of an air pump. The top of the tool is pref. fitted with lifting handles. Electrical push-buttons adjacent to the handles pref. operate solenoid valves to connect the tool chamber to suction or delivery side of the air pump.

Used in mfg. pastry tart bases, pizzas etc. cutting tool does not have to be pressed into the paste, so operator fatigue is reduced

and high output achievable, e.g. 15 blanks per minute per operator. The tool is simple, light wt. and inexpensive. (7pp)

SAKU/ ★ D11 72971 D/40 ★J8 1038-101
Porous noodle prepn. - by high frequency irradiation at 300-4000 MHZ

SAKURAZAWA H 09.03.78-JP-026870
(04.09.81) A231-01/16

09.03.78 as 026870 (22AT)

Noodles are subjected to irradiation with high frequency radiation of 300-4000 MHZ for 10-180 secs. to form porous structure by evapn. of the water. The resultant noodle is heated at 30-160 deg.C for 10-90 mins. (J54119047) (6pp)

FATE- D11 41693 B/22 = J8 1038-166
Single pack dried baking mixt. - contg. yeast and opt. chemical rising agents, e.g. for domestic prodn. of bread, rolls, etc.

PATENT TECHNOLOGY 11.11.77-US-850475
(04.09.81) *NL7811-185 A21d-10

10.11.78 as 138745 (513WB)

Packaged baking mixt. for domestic use comprises a dry mixt. of (i) 75-85% flour with a moisture content of less than 8%, (ii) 1.75-3.25% special dried active yeast with a moisture content of less than 5 wt.%, (iii) 4.5-7.5% of a dry filler material with a moisture content of less than 2 wt.%, (iv) ca.5% dry flavouring ingredients, and (v) 0.5-5% dry dough conditioner and/or improving agents. The mixt. is packaged and sealed in oxidn. - and moisture protective packaging.

The prod. is supplied in a single package in dry form, which is stable for long periods on storage. The prods. can be used to make a wide range of yeast-risen prods. on a domestic scale, such as bread, rolls, pancakes, biscuits, waffles, pizza bases, etc. (J54089055) (13pp)

GENM ★ D11 73468 D/40 ★US 4289-470
Dough ribbons shaped as lasagna strands - by pair of rollers with crimping edges

GENERAL MILLS INC 30.04.80-US-145275
(15.09.81) A21c-11/24

30.04.80 as 145275 (295AT)

A dough ribbon is passed between a pair of vertically aligned rollers which are rotated about parallel horizontal axes. Each roller has a toothed portion at each of its longitudinal ends and these toothed sections mesh to crimp the dough ribbon along its edges. The upper and lower roller are contrarotated by gears connected to a common motor.

Pref. the appts. includes at least two pairs of rollers each of which has crimping teeth. Pref. some of the rollers can be adjusted on their shafts to ensure the correct meshing with the mating rollers. The roller can then be locked to the shafts to preserve the mesh.

The appts. forms lasagna strands. (9pp)

BONG/ D11 51688 D/20 = WP 8102-506
Truck for bakery oven with air-recycling - with elements guiding air holding supports for loaves which facilitate and penetration between loaves and minimise energy consumption

BONGARD P 04.03.80-FR-005108
(17.09.81) *BE-887-758 + A21b-01/26

03.03.81 as F00027 (1192RH) (F) DE2422186 FR2265280 DE2628430 N(DE JP US) E(DE GB NL)

A truck for a bakery or similar oven with air recycling, constituted by four uprights fixed on a rolling carriage and connected together, incorporates elements for guiding and holding supports for loaves which present, on their side turned towards the collectors for blowing air, a form favouring an aerodynamic flow of the air with channeling of the air between the supports. They have a V profile, the bisector of the angle of the V extending parallel to the flow of air.

The penetration of hot air between the supports for loaves is better than in existing ovens. The consumption of energy is less because of the elimination of turbulences. Perfect regularity of baking is ensured with good protection of the outer loaves. (10pp)

D12: MEAT; FISH PROCESSING

UNIC ★ D12 71769 D/40 ★ BE -887-928
 Large dia. tubular cellulosic food casing - contg. specified chloride(s) to inhibit propagation of moulds etc.
UNION CARBIDE CORP 13.03.80-US-130190
 + P43 (14.09.81) A22c-13 A231-03/34 B08b-13
 12.03.81 as 887928 (597RH)
 The casing, previously moistened to a degree such that it does not require further moistening before being filled, contains NaCl, KCl, CaCl₂, NH₄ Cl or MgCl₂ in a consn. such that the water activity of the casing is maintained at a value not above 0.81. Mfr. of the casing comprises adding water to establish a 20-40% moisture content and 2-22.6% NaCl, 2.6-68.7% KCl, 4.1-35.9 CaCl₂, 3.1-33.2 NH₄Cl and 2.9-22% MgCl₂, based on the cellulose.
 Used for salamis, Bologne sausages etc. the use of the salts both avoids the need for further moistening and also inhibits the propagation of moulds, yeasts and bacteria. (35pp)

MAJA- ★ D12 71788 D/40 ★ BE -888-858
 Machine for stripping skin from meat, bacon, fish etc. - has resiliently displaceable pressing roll to accommodate wide range of prod. sizes

MAJA-MASCH SCHILL H 29.05.80-DE-020351
 (16.09.81) A22c
 19.05.81 as 888858 (448AT)
 Machine for stripping skin from meat, fish etc., esp. rind from bacon and ham has a feed roll to carry the prod. against an adjustable stripping blade while a pressing roll pushes the advancing prod. towards the cutting edge of the blade.

The machine is equipped with a feed unit via which the prod. is advanced towards the feed roll. The feed unit prevents an operator's hand loading in the prod. having access to the danger zone of the stripping blade. The pressing roll bearings are now mounted on a linkage which allows the pressing roll axis to be displaced along two coordinates w.r.t. the feed roll and the stripping blade. The pressing roll is spring-loaded towards its nearest posn. to the blade cutting edge. The linkage pref. comprises two opposed, support arms of which one is pivotally linked to the machine frame and the other resiliently mounted on the frame.

The mounting of the pressing roll makes the machine self-adjusting to accept a wide range of prod. sizes. (24pp)

MOHN/ ★ D12 71817 D/40 ★ DD -149-306
 Fish processing transport system - using one belt conveyor with side plates and movable stop plates for storage
MOHNKE H 03.03.80-DD-219386
 (08.07.81) A22c-25/08
 03.03.80 as 219386 (39DH)

Transport system between consecutive fish processing machines, e.g. between scaling and heading machines of mackerels of the species *trachurus trachurus*, consists of a single endless conveyor. It runs between pairs of side plates which can be turned by a stop plate across the belt into an accumulator space. The fish can be removed mechanically or manually to a process machine and then returned to the belt.

This results in an optimum arrangement of the various machines and in combining the functions of conveying, accumulating and distributing. (7pp)

FARH ★ D12 71884 D/40 ★ DE 3008-920
 Tubular cellulose hydrate sausage skin - externally coated with copolymer contg. vinylidene chloride, methyl methacrylate, methacrylonitrile and itaconic acid
HOECHST AG 08.03.80-DE-008920
 A97 P42 P73 (A14) (24.09.81) A22c-13 B05d-07/04 B29d-09 B32b-07/02
 08.03.80 as 008920 (200RH)

Tubular, esp. fibre-reinforced cellulose hydrate sausage skin is externally coated with a vinylidene chloride copolymer film. The copolymer consists, by wt. w.r.t. total copolymer wt., of 86-89 (87.3) % vinylidene chloride, 5-7 (5.9) % Me methacrylate, 5-8 (5.8) % methacrylonitrile and 0.5-1.5 (1) % itaconic acid. A 0.1 wt. % copolymer soln. has relative viscosity 1.09 and its 3 wt. % soln. has relative viscosity 2.85, measured in a tetrahydrofuran and toluene mixt. in vol. ratio 70:30 at 23 deg.C. Copolymer film thickness corresponds to wt./area 3-12 g/sq.m.

The sausage skins with film coating wt./area 8-10 g/sq.m. are partic. suitable for liver sausage. The coating has a low residual solvent content, e.g. less than 10 (1.9) mg/sq.m. for wt./area 5-10 g/sq.m. The E-modulus of the aged sausage skin

water-vapour and O₂. (27pp)

 10.03.80 as 009119 (39AT)

Freshly made sausages are dried by air circulation in a drying chamber in which air with a temp. of 10-24 deg.C and at a relative humidity of 70-90% is circulated. At intervals of not over 30 min the small ventilator for the external circulation is boosted by an internal axial fan of 10 to 20-times greater capacity for an intensified internal circulation.

The drying chamber in which the sausages are suspended receives air circulation from the circuit which extends from the outlet through an air cooler, a heating element and a small fan to the inlet. An axial fan is switched on and off by a time relay, e.g. ON for 10 min. and OFF for 20-30 min. An initial temp. of 10-15 deg.C and a relative humidity of 80-90% are held until the sausages have reached a moisture content of 32-38%. The a temp. is then raised to 20-24 deg.C and the relative humidity reduced to 70-75%.

This results in an accelerated moisture extraction from the sausages, a better quality, and saving of power and time. (24pp)

FISC- ★ D12 71990 D/40 ★ DE 3010-4
 Mackerel treatment to achieve smoked salmon taste - sprinkling with condiment-contg. salt and sugar mixt., ripening and opt. smoking
FA FISCHHAUS HOLST 19.03.80-DE-010473
 (24.09.81) A23b-04/04
 19.03.80 as 010473 (200DH)

Mackerel is up-graded by sprinkling 100-150 kg freshly fillet fat-contg. fish with a powder contg. 3 kg salts, 2 kg sugar, sm quantities of acid condiment, flavouring additives and dyestuffs. The treated fish are ripened 48 hrs. in container under pressure, a little above freezing-point temp. and then cold-smoked, pref. at no higher than 20-22 deg.C.

The treated mackerel acquires a salmon taste and texture. The fish is ready for use and can be cold-stored without preservatives and without vacuum packing, for at least 3 weeks. (6pp)

 Frozen meat slicing guillotine - with automatic return on end stroke or excessive cutting resistance
VEB KOMBINAT NAGEMA 07.03.80-DD-219518
 P62 (24.09.81) B26d-05/02
 29.11.80 as 045065 (39KB)

A guillotine-type of cutting mechanism for frozen food, e.g. frozen meat blocks in meat processing establishments, has a counter blade on which the meat block rests at a distance from a stop which governs the thickness of the slice to be cut. A hydraulic power cylinder pulls the guillotine blade down to perform the cut.

On reaching the end of the stroke, the hydraulic pressure builds up and actuates a pressure sensitive switch which reverses the control valve and returns the blade to the initial position. If the block is frozen too hard, the same action causes an automatic repetition of the impacts until the block is cut through.

This guillotine operates fully automatic and is not overloaded. (9pp)

Multistage evaporation of liquid esp. milk - using vapour recycling with mechanical compression between stages

STORK FRIESLAND BV 17.03.80-NL-001576

(23.09.81) A23c-01/12 B01d-01/28,

13.03.81 as 200282 (295DH) (E) FR2442886 CH-192147 CH-262259 CH-228206 GB-187260 DS1142162 NL6515445 E(AT BE CH DE FR GB IT LI LU NL SE)

A liquid is heated in an evaporator by contact with vapour. Concentrated liquid is advanced to a downstream stage at which the liquid has a lower boiling point and is again contacted with vapour to further concentrate the liquid. Vapour from downstream stage is then mechanically compressed and fed to upstream stage.

The stages of the apparatus are arranged in groups and the liquid passes serially through each stage. Each group has a smaller number of stages than its adjacent upstream group. Vapour is recycled through each group by a single mechanical compressor.

As the liquid becomes more concentrated it passes through groups of less stages. In the final stage the maximum temperature differential exists between the liquid and vapour yet the risk of dry boiling is minimised. (17pp)

Aspartame prodn. from synthetic polypeptide - produced by cloned microorganism

CETUS CORP 14.03.80-US-130462

B05 E14 (23.09.81) A23l-01/23 C07c-103/52 C12n-01/20 C12n-1 C12p-21/02 C12r-01/19

02.03.81 as 300857 (367BE) (E) No-Citns. E(AT BE CH DE FR GB IT LI LU NL SE)

Prodn. of aspartame, i.e. aspartyl-phenylalanine methyl ester (I), is carried out by first synthesising double-stranded DNA in which a coding strand has alternating codons for Asp and Phe in sufficient no. to produce a polypeptide (II) which is stable in a predetermined host microorganism.

The DNA strand is then inserted into a cloning vehicle so that the resulting chimera directs the synthesis of (II), the chimera is introduced into the predetermined host microorganism, and the microorganism is cultivated to produce (II). (II) is then converted to (I) by (a) benzylating the free COOH gps. in the Asp units; (b) fragmenting the benzylated polypeptide to produce benzyl-Asp-Phe; (c) methylating the COOH gp. in the Phe unit; and (d) debenzylating the Asp unit by hydrogenolysis.

(I) is an artificial sweetener. The process allows (I) to be produced in large quantities once the (II)-producing microorganism has been developed. (18pp)

Pelletiser drum quick coupling device - with conical wedges for rapid fixing to drive head, e.g. for feedstuffs pelletiser

MECCANICA DIREFFO 13.05.77-IT-085580

C03 J04 P71 + P12 (30.09.81) *DE2756-647 + B29c-01/16 31.03.78 as 012646 (1358TM)

A cubing machine, e.g. for animal feedstuffs, has a mechanism for releasing and locking the die consisting of a resilient ring with conical surface with cuts permitting reduction in diameter, and an outer member with internal conical surface surrounding the ring. Studs are connected to the ring and springs are held in compression by stud heads.

The ring is drawn onto the member surface so that the ring is reduced in diameter to clamp its interior surface onto the die. The studs are movable axially so that the ring can expand to release the die. The member is pref. an outer hardened steel ring and an annular piston engages the studs to release the resilient ring from the outer ring. (3pp)

Para-methoxy-benzaldehyde prodn. - by oxidn. of cresol with manganese dioxide in sulphuric acid, at specified redox potential

RUBEZHAN VOROSH MAC 30.03.79-SU-758729
B05 E14 (D23) (07.01.81) C07c-45 C07c-47/56

30.03.79 as 758729 (938WD)
Para-methoxy-benzaldehyde is used in pharmaceutical and food industries and in perfumery.

It is prepd. by the oxidn. of para-cresol with manganese dioxide in sulphuric acid medium at 69-72 deg. C, using above reagents in molar ratio of 1:(1.65-1.7)

The yield of the final prod. is increased and its purity is improved if the process is conducted at redox potential of 0.55-0.60V. After phase sepn. the organic phase is cooled to 9-10 deg. C and the crystalline prod. is sepd. by filtration and is purified by vacuum distillation.

The method increases the final prod. yield from 46-55% up to 73-75% and reduces the consumption of the oxidn. agent by 16%. Bul.1/7.1.81. (2pp)

Gas burner, esp. for heating a deep fryer for frozen foods, has a gas supply manifold with at least two discharge nozzles for convergent gas jets which meet before they hit a target mounted on the manifold. The target is inclined towards the jets, to intercept them and divert them into a combustion zone, into which the target reflects heat. Projections on the target surface promote turbulence between the gas and secondary air.

Pref. jets are diverted towards a vertical wall of the deep fryer, against which is the combustion zone. (8pp)

Appts. for sepg. rubbish from bean sprouts - having vibrating belt moving rubbish in one direction and sprouts in opposite direction

DAISEI KIKAI KK 06.03.79-JP-025753 (06.03.79-JP-025752)

P43 (15.09.81) B07b-01/10

12.12.79 as 102914 (295AT)

An appts. for sepg. bean sprouts from waste includes a vibration frame with a perforated endless belt driven in a first direction. A cleaning device is stationary and removes deposits from the belt.

A vibrator vibrates the frame in a direction having a component opposite to the first direction. In one embodiment the belt is replaced by a series of screens arranged stepwise.

The appts. separates freshly harvested bean sprouts from refuse, bean shells, rootlets etc. The bean sprouts do not have to be immersed in water and thus their freshness-keeping properties are improved. (8pp)

Ice cream cone with sanitary jacket - sepd. by adhesion-reducing
agent and selectively removable without damage

MARYLAND CUP CORP 04.05.79-US-036227 (10.03.78-US-885278)

Q35 (15.09.81) A21d-13 B65g-59

04.05.79 as 036227 (+ 10.3.78-US-885278) (295AT)

A sanitary jacket is adhered to an ice cream cone by interposing a mixt. of water and an adhesion-reducing agent between the jacket and the cone. The jacket and cone are brought into juxtaposition with the mixt. interposed between them and are then dried.

The adhesion-reducing agent consists of a food grade, non-toxic and hydrophilic material. It may consist of an alcohol, a natural sugar syrup, or a surfactant mixed with water in an amt. sufficient to cause the adhesion while at the same time permitting sepn. of the jacket and cone with no jacket or cone tearing.

A baked ice-cream cone is provided with a sanitary protective jacket which is easily removed without damage to the cone. (7pp)

LAND-★ D13 73623 D/40 ★US 4289-793
Mr. of large rectangular cheese blocks - with whey drainage
through tapered, perforated posts with diamond-shaped cross-
section

LAND OLAKES INC 12.05.80-US-148990 (08.01.79-US-001598)
(15.09.81) A23c-19/05

12.05.80 as 148990 (295AT)

Cheese is mfd. from curd by filling a container having a removable bottom and side walls and an open top. Perforated and tapered posts extend from the bottom wall for substantially the height of the container. Each post has a diamond-shaped cross-section. A pressure plate exerts a downward pressure on the curd to compact it and to expel whey through the posts. The pressure is continued until the surface of the pressure plate is just spaced from the tops of the posts. The container is then inverted and the bottom wall together with posts is removed.

Further downward pressure is applied to cause closing of the apertures produced by post withdrawal and to permit knitting of the cheese to provide a block of uniform texture.

For mfg. large rectangular blocks of cheese weighing six to seven hundred pounds. (11pp)

GENO ★ D13 73624 D/40 ★ US 4289-704
Gasified candy with pronounced popping sensation when eaten -
obtd. by cooling gasified sugar melt at superatmospheric
pressure

GENERAL FOODS CORP 12.03.80-US-129513
(15.09.81) A23g-09

12.03.80 as 129513 (558)

Gasified candy is prepd. by gasifying a sugar melt at superatmos. press. and cooling the melt below its fusion temp. under superatmos. press. The melt is kept at below 280 deg. F during the gasification to produce in the candy prod. observable gas bubbles, the majority of which have dia. above 225 microns. The gasifying gas is CO₂, N₂ or air.

The sugar melt pref. comprises glucose, fructose, sucrose, lactose and/or corn syrup. The majority of observable gas bubbles in the prod. suitably have dia 225-350, pref. 300-350, microns.

The candy produces a more pronounced popping sensation when eaten, compared with conventional gasified candy. The number of unacceptable batches produced can be kept low. (6pp)

30.07.73 as 338504 (39KB)

A liquidiser for fruit etc. consists of a motor with a vertical shaft, suspended in vibration absorbing rubber pads and driving a perforated bowl with a grating bottom, against which the fruit can be pressed by a pestle. A partition divides the upper part of the casing into a chamber for the solids and one for the juice.

The juice runs off an inclined plane into a space where a beaker can be pushed in. The beaker has at the bottom a whisk on a spindle passing through the bottom and carrying a magnetic disc. Another magnetic disc, driven by the motor, acutates the whisk.

This combines the liquidising with a whisking operation.(PS) (7pp)

 Microwave treatment of food - with high velocity jets of heated gas directed onto food to remove surface moisture

SMITH DP 16.03.79-US-021261 (19.05.76-US-687982)

X27 (15.09.81) A21d-06

16.03.79 as 021261 Div.ex 4154861 (295KB)

Food is thawed, cooked or heated by delivering microwave energy to it and simultaneously directing streams of high velocity gas perpendicularly to the food surface. The streams impinge against discrete areas of the food prods. before the gas is diffused. This wipes away the boundary layer of air and moisture.

The food prods. are moved relative to the gas streams. Heat is transferred to the surface of the food prods. at areas on which the gas streams impinge to increase the surface temp. at the areas of impingement before these areas move out of impinging relation with the gas streams.

The appts. may be used for cooking, thawing or browning

foods, e.g. frozen fish, meat patties, chicken pieces, pies. The jets of gas can produce surface browning and heating by removing moisture from the surface of the produce. (16pp Dwg.No.6)

Water treatment system - continuing air flow through tower after stopping water supply to blow clean contact elements
 MASCH BUCKAU WOLF R 07.03.80-DE-008725 (00.00.76-DE-617945)
 (24.09.81) C02f-01

07.03.80 as 008725 Add to 2617945 (39HM)

The parent patent DE2617945 described a system for water treatment, specially for the removal of dissolved surplus carbon dioxide of soft water, in a tower with several contact packings. After the water supply to the tower has been cut off, the air supply is continued until the contact elements have been dried out thoroughly.

The wet surfaces of the contact elements are thus blown dry by the air flows and any suspended particles are removed together with the residual water. This keeps them clean so that they need only be cleaned very rarely and downtimes are eliminated.

The result is that particles suspended in water can run off more quickly and that the growth of suspended particles such as iron, manganese etc. on the packing elements is prevented. (6pp)

(24.09.81) C02f-01/14

17.03.80 as 010208 (39AT)

The desalination of seawater is effected by distillation through a mat or woven tissue to which seawater is applied and from which brine with a higher salt content is extracted after some has been evapd. The water vapour is condensed and used for consumption.

The mat is heated by a heat exchanger which is traversed by a circulating heat carrier liq., heated through a solar heat collector. Before the seawater reaches the mat, it is passed

through the condenser for the water vapours from the mat.

A casing supports a heat exchanger with an inlet and outlet to which a mat has been applied. Seawater is first passed through a condenser with an inlet and outlet and from the latter it is sprayed through nozzles in a pipe over the mat. Brine is discharged through pipe and desalinated water through the pipe.

This is a simple and lightweight installation which supplies large quantities of desalinated water and requires no extraneous energy. (12pp)

The oxygen input in a reactor, which is filled with a mixed fluid, e.g. the aeration basin of a biological treatment plant or a bioreactor, is determined by measuring in turn during the operation of the reactor the oxygen content of the fluid, and the oxygen content of the fluid, and the oxygen content change of a circulating part of the fluid.

Both measurements are carried out at a constant flow incidence against an oxygen electrode at values above a minimum. The change rate is measured after the admixture of pure O₂ of H₂O₂.

This minimises the error and facilitates the measurements. (8pp)

A grid consisting of mutually parallel rods be moved transversely in a stream of fluid, forms part of an installations for purifying e.g. water in a drain trench. The upper end of the grip projects out of the fluid up to a gutter of similar drain. On the rear side of the rods of the grid, is at least 1 toothed beam. The beam extends parallel to the grid and at right angles to its rods. This can be lifted by a driving mechanism over the full height of the grid and a closed circuit, with a rising and falling cadence. During the rising motion, the teeth project between the rods of the grid.

At at least 1 end of the beam, there are levers with at least 2 separate supports, one of which at least is outside the beam axis of rotation. The levers are displaced along two different guide paths which have two straight sections parallel to the grid and two curved sections which join the straight sections. At the beginning of the sinking motion, the teeth are tilted backwards into an inactive position along the sinking motion.

At the transition between the sinking and the rising motion, they are turned back into the active position in which they extend between the grid rods. During the rising motion one support moves forward into a more advanced position relatively to the others, and the condition is reversed during the downwards motion. This changeover takes place on the curved sections of the guide paths. The supports are moved constantly together in the direction in which the beam is being moved.

The swinging over of the teeth between the rising and falling motion and between the falling and rising motion place smoothly without risk of blocking and always according to a combined translating and rotating motion. (23pp)

A highly asymmetric polymeric membrane comprises a skin and a porous support. The skin has an av. pore dia. of 0.005-3.0 microns and the support has a reticulated structure contg. pores of sizes ranging from 10-20000 x as large as the av. pore dia. of the skin pores. The membrane has a bulk porosity of above 70%. Pref. ratio of max. pore size to av. pore size within the skin is below 5.

Pref. polymer is polyarylsulphone, polyimide, polycarbonate, polyacrylonitrile, polyquinoxaline and polyquinidine.

The membranes are used as ultrafilters of microfilters and have improved flow rates and dirt holding capacities, excellent retention properties and improved resistance to fouling. (33pp)

 Tube pressure filter esp. for clay slurries - has two coaxial tubular assemblies defining annular chamber divided into compartments by elastic sleeve

ENGLISH CLAYS LOVER 18.03.80-GB-009098

J01 P71 (23.09.81) B01d-25/12 B01d-29/14 B30b-09/22

18.03.81 as 301082 (67KB) (E) No-Citns. E(AT BE CH DE FR GB IT LI LU NL SE)

The filter comprises a pair of coaxial inner and outer tubular assemblies defining between them an annular chamber which is divided by an impermeable elastic sleeve into non-communicating inner and outer compartments. A filter element is disposed around and supported by the inner tubular assembly. A slurry to be pressure filtered is fed to the inner compartment and a hydraulic fluid is circulated through the outer compartment between an inlet and outlet.

The tubular assemblies can be moved relative to one another to establish three operating positions. In the first the slurry inlet communicates with the inner compartment but the inner compartment is otherwise closed. In the second the inner compartment is closed and is isolated from the slurry inlet so that the slurry to be pressure filtered can be dewatered. In the third the inner compartment is open so that particulate solids can be discharged from it.

Used in pressure filtering of clay slurries and waste water from paper mills.

Capable of filtering slurries contg. coarse, granular or fibrous solids at high pressures. (21pp)

An installation according to claim 2 of the principal patent comprising a denitrification reactor functioning anaerobically and a nitrification reactor functioning aerobically is characterised in that one and/or the other of the reactors consists of a granular filter bed on which microbial cultures are fixed through which the water to be treated is passed. The principal patent relates to the use of heterotrophic bacteria in the 1st and autotrophic bacteria in the 2nd system with recycling of water from the 2nd to the 1st system. The above replaces an active sludge basin and/or a bacterial bed.

The installation avoids the need for clarifiers. (4pp)

Filter system for waste water contg. magnetic substances - includes sealed tank between poles of electromagnets

BIRU DAIKO KK 25.01.80-JP-007502

J01 (22.08.81) B01d-35/16

25.01.80 as 007502 (26DH)

Device for filtering a liquid such as waste water containing magnetic substances, comprises a closed tank and electromagnets attached at the tank. In the conventional device, the tank was back washed to remove filter residues in the tank. This required several treatments of the residues, after removing them from the filter tank.

To avoid such treatments, the tank is between the magnetic poles of the electromagnets to filter the liquid. After filtration, the tank is dumped, without removing residues. The tank may be carried on a carriage for convenience of dumping. (2pp Dwg.No.1)

Electromagnetic filter for nuclear power plant liq. waste - with disposable box between two poles associated with yoke around which a coil is wound

BIRU DAIKO KK 25.01.80-JP-007503

K07 (22.08.81) B01d-35/06

25.01.80 as 007503 (26DH)

A device is claimed for filtering a liq. wasted from a nuclear power plant. The liq. contains radioactive and magnetic substances, which must be safely dumped. The device comprises a closed box and filter element contained in the box.

The box is between a pair of large poles serving for shielding the radiation from the substances contained in the liq. fed into the box. A yoke and coil wound around the yoke is disposed near to the poles to excite them, while filtering the liq. by the element. After filtering, the box is dumped. (3pp)

MITQ ★ D15 72915 D/40 ★ J5 6105-724
Producing water from atmosphere in desert areas etc. - using device with shutters at feed and discharge openings of adsorption column

MITSUBISHI ELECTRIC CORP 28.01.80-JP-008979

(22.08.81) B01d-53/26 C02f-01/04

28.01.80 as 008979 (26DH)

Device is described for producing water from the water content of the atmos. in a dry area such as desert. It comprises an adsorbing column for adsorbing the water content with an adsorbant and condenser for condensing the desorbed water content. The object is to improve the sealing effect of the column to avoid leaking of water content at the time of desorbing. The novelty is that shutters are attached at an air feed and discharge openings of the column and combined with respective structures, each for closing the opening air-tightly. Each structure has a packing attached at the opening and a closing member closely contacted with the packing. (4pp)

TOSI ★ D15 72925 D/40 ★ J5 6105-738
Slurry dewatering extruder - has auxiliary screw rotating in opposite direction to two main screws

TOSHIBA MACH KK 25.01.80-JP-007571

Powder e.g. dried dust and sludge granulation - by addn. of thermoplastic substance e.g. coal tar etc. and stirring at high speed

OKAYAMA-KEN KANKYO 28.01.80-JP-009220

A81 J04 (22.08.81) B01j-02/10 C02f-11

28.01.80 as 009220 (26AT)

Method is for granulating a powder e.g. dried dust and sludge which may contain harmful metal waste from factories. The powder is effectively granulated without scattering.

The novelty is that a thermoplastic substance hydrophobic to the powder with a m.pt. of 50-250 deg.C is added to the powder. The mixt. is stirred at high speed until a frictional heat is generated between the powders to melt the thermoplastic substance, so that the powder is pelletised. The thermoplastic substance is e.g. coal tar, polyester polymers, etc. For stirring the mixt., a high speed mixer may be used, operable at 3100 rpm. (4pp)

KATA-★ D15 72945 D/40 ★ J5 6105-790
Processing cooling water effluent from damped down blast furnace - involves adjusting pH to predetermined range, then adding iron salt and opt. aldehyde cpd.

KATAYAMA KAGAKU KOG(YAWA) 28.01.80-JP-008496

M24 (22.08.81) C02f-01/58 C21b-07

28.01.80 as 008496 (34DH)

Polluted cooling effluent resulted in injecting downwardly cooling water into the inside of blast furnace to cool down the contents in damping-down of blast furnace is subjected to treatment for recirculation by adjusting its pH to 6-8, pref. 7.5-8.5, and adding an iron salt e.g. FeCl₂, FeCl₃, FeSO₄ and Fe₂(SO₄)₃ etc. and if necessary an aldehyde cpd. e.g. formaldehyde, acetaldehyde or condensates thereof in a settling vessel to precipitate cyan components together with pollutants and to reuse supernatant liquor as the cooling water.

By this process, the amt. of pH-adjusting agent to be used is saved, and the amt. of the aldehyde cpd. to be used is about 1/10 times as that of conventionally used NaClO, so that the treating cost is significantly decreased.

In a modification the aldehyde cpd. is added to the cooling water to be injected into the blast furnace to convert the pollutants into water-soluble harmless cpds. The pollutant content of the cooling effluent discharged from the furnace is decreased and amt. of insoluble iron complex salt formed in the settling vessel is decreased considerably. (8pp)

MITR ★ D15 72946 D/40 ★ J5 6105-794
Removing sulphate and heavy metal ions from water - by passage through column filled with granular calcium hydroxide, calcium carbonate and opt. an inorganic binder

MITSUBISHI RAYON KK 28.01.80-JP-008629

(22.08.81) C01f-11 C02f-01/58

28.01.80 as 008629 (34DH)

Substances capable of forming a difficult by soluble salt with Ca(OH)₂, e.g. SO₄ and heavy metal ions etc. are removed from water contg. them by passing through a column packed with granular solid alkali matter comprising Ca(OH)₂, CaCO₃ and optionally a binder e.g. Al₂O₃, SiO₂, Mg(OH)₂ and CaSO₄, MgO etc. to form difficult soluble salt which is then removed by sedimentation.

The granular solid alkali matter exhibits excellent strength in H₂O and enough water solubility, and its Ca(OH)₂ content should be 20-95 wt.%. The solid alkali matter exhibits no collapse in water and exhibits almost constant dissolution rate over a long period, so that its installations and operation maintenance becomes very easy. When sediments are deposited on the surface of the solid alkali matter to such an extent that dissolution of the solid alkali matter is extremely suppressed, air or water is passed through the column to remove the sediments and to recover the dissolution rate. (4pp)

19.05.80 as 150913 C.i.p.4203836 (+ 13.7.78-US-924373) (295RP)

Suspended solids are removed from a liq. using an appts. consisting of a base supporting a pan within which is mounted a perforated plate secured to the side and end walls of the pan. There is an outlet in the bottom of the pan through which a vacuum may be applied.

A continuous support lies on the plate and forms a loop around the pan. It is guided around rollers and is connected to a drive. A liquid-absorbing medium comprising industrial paper towelling is positioned on the continuous support within the pan. A liquid contg. suspended solids is introduced onto the liquid-absorbing medium, the liquid supply being controlled by the depth of liquid in the pan. The pan outlet is connected to a liquid receiver which in turn is connected to a vacuum pump.

Used for treating waste water from electroplating or metal finishing processes. It provides quicker and more effective removal of pptes. than is possible with settling tanks. Immiscible liquids can also be sepd. (9pp)

WATE- ★ D15 73541 D/40 ★ US 4289-617
Water softening and reverse osmosis system - with semipermeable elements embedded in pelletised softening bed

WATER REFINING CO 05.05.80-US-146956

(15.09.81) B01d-57

05.05.80 as 146956 (295AT)

A water softening and reverse osmosis treatment system includes a pressure tank with an inlet line for hard water, and an outlet line for softened water. Treatment material for softening the water is located in the tank. Semi-permeable reverse osmosis membranes are embedded in the treatment material and water passing through the membranes can be separately collected.

Pref. the softened water outlet line has its mouth below the membranes adjacent the tank bottom. The treated water from the membranes is pref. passed through a conduit to a holding tank fitted with a float valve to control the flow.

The system produces softened water, and water with a reduced dissolved solids content. The treatment material traps large particles which would normally collect on the surface of the membranes and cause clogging. The system can be retrofitted to an existing water softening pressure tank. (6pp)

Bar screen for waste water stream - having cleaning rake driven by endless chain along spaced cleaning and return strokes

SAMPSON M J 11.08.80-US-177199

(15.09.81) B01d-35/16

11.08.80 as 177199 (295NS)

Debris is collected on an inclined screen positioned in a refuse-laden stream. A reciprocating rake removes the debris from the screen. The screen is mounted at the lower end of a frame adjacent lower and upper parallel tracks. The rake slidably rides on the lower track in engagement with the screen on an upward cleaning stroke. It slidably rides down the upper track out of engagement with the screen on a return stroke. A power driven motor is mounted on the upper frame and has an endless chain with it. The

The screen and rake are used in a waterstream of sewage or industrial waste. The drive for the rake is clear of the water and therefore available for servicing and maintenance. (8pp)

IGTE ★ D15 73545 D/40 ★ US 4289-625
Hybrid bio:thermal gasification - using anaerobic digester and thermal gasifier

INST OF GAS TECHNOL 18.01.80-US-113242

H06 (15.09.81) C02f-03/28

18.01.80 as 113242 (921KB)

A hybrid bio-thermal gasification process comprises (a) anaerobically digesting a biological feed under thermophilic or mesophilic conditions in a digester (A) contg. an active liquid culture while introducing a gasification prod. (I) into the culture, (b) withdrawing (i) a prod. gas (contg. CH₄ and CO₂) and (ii) a biological residue from (A), (c) gasifying at least a substantial part of the biological residue in a thermal gasifier (B) to produce thermal gasifier prod. (II) and thermal residue (III), and (d) using at least a portion of (II) or its derivs. as (I) in (A).

Process is capable of handling a wide variety of biological feedstocks (terrestrial or aquatic plant material, organic waste, peat, etc.) of high water content (e.g. above 50%) for the efficient prodn. of urethane-contg. gases. Nutrient recycle reduces external nutrient requirements. (9pp)

X25 (17.09.81) B01d-35/06

11.03.81 as U00304 (295AT) (E) US2652925 US4146479 US4210535 US4153559 US2939830 1.Jnl.Ref N(AU BR DE GB JP SE) E(AT)

Mineralised flowing water is treated magnetically by passage through a conduit disposed in the axial hole of a magnet. The magnet is cylindrical and is axially magnetised with an axial hole of uniform cross-section accommodating the conduit. The conduit is formed of a non-magnetic material. The magnet is shaped and positioned to maximise the magnetic flux in the axial hole.

The magnet may be either a permanent one or a direct-current coil. Pref. the conduit within the confines of the magnet is straight and smooth to minimise water turbulence.

The appts. is used to magnetically treat water to reduce boiler scale. The magnetic field is used to change the hardness characteristics of the water, generally to reduce its hardness although flow may be reversed through the magnetic field to increase the hardness. (14pp Dwg.No.1)

Sheet material for rotating biological contactor - formed with embossing spacing apart adjacent sheets with interlocking teeth and grooves

NORDISKA VATTENPROJ 10.03.80-WP-SE0070

(17.09.81) C02f-03/08 C12m-01/10

10.03.80 as 000070 (295KB) (E) DE2806415 SE7801463 SE-353301 DE2554757 DE2443053 CH-441140 1.Jnl.Ref N(BR JP SU US) E(AT CH DE FR GB LU NL SE)

A material for a rotating biological contactor (RBC) consists of sheets with embossings formed on them. These spaces adjacent sheet layers. At least some of the embossings are formed with protrusions which can grip into grooves formed in rows on an adjacent sheet.

Pref. the protrusions are in the form of teeth, the grooves and teeth having corresponding lengths giving lateral and longitudinal guidance and locking. There may be more grooves than teeth so that the teeth can always grip a groove even when the sheets are spirally wound and the radius and thus the distance between the embossings change.

The RBC is used in the processing of waste water. It is rotated slowly alternately exposing microorganisms to substrate and air. (8pp)

Farmyard manure gas mfr. - in successive fermenters with downpipes feeding successive tanks at bottom
 GUNTER E 17.03.80-DE-010183
 + P11 (23.09.81) A01c-03/02 C02f-11/04 C12m-01 C12p-01 C12p-05/02

17.01.81 as 100345 (39DH) (G) No-Citns. E(AT BE CH DE FR GB IT LI LU NL SE)

Farmyard manure or fermentation gas is produced by feeding the raw material by a pump to the bottom of a first fermenter where it rises, as gas develops, and descends from the top through a downpipe to the bottom of the next fermenter. This is repeated several times until the sludge is collected in a sludge pit. A pipe leads from the top of each fermenter to a gasholder.

This eliminates the disturbance in the gas production of the bacteria which is caused by stirring or other quick change of the influential factors. The result is a greater gas production and a saving of the stirring mechanisms. (23pp)

Prodn. of activated liposomes is carried out by oxidising liposomes having an outer layer of lipid mols. with polar heads and nonpolar tails. The polar heads have oxidisable gps. which are oxidised to CHO gps. The liposome-forming lipids are pref. selected from lactosylceramide, galactocerebroside, trihexosylceramide, phosphatidylglycerol, phosphatidylinositol and gangliosides, opt. in admixture with less than 90 mole % of other lipids (esp. phosphatidylcholine or sphingomyelin). The liposomes are pref. unilamellar, but can contain cholesterol to reduce permeability.

Activation can be effected by oxidn. with periodate or Pb(OAc)₄, pref. with a soln. of NaIO₄ in a polar solvent using 1.5-6 moles NaIO₄ per mole of lipid. Proteins can be coupled to the activated liposomes by reaction in a polar solvent in the presence of Na cyanoborohydride. The protein is pref. an antibody contg. at least 20 lysyl units, esp. IgG or F(ab')₂. Loss of antigen-binding capacity should be less than 90% during coupling. Specifically claimed activated liposomes have binding sites capable of covalently binding at least 40 mcg of IgG per micromole of total lipids.

The activated liposomes can be covalently coupled with specific antibodies via the surface CHO gps. When the liposomes contain an encapsulated drug, DNA, enzyme, etc., this may improve the specificity with which the encapsulated material is delivered to a particular target site in the body. (23pp)

NMR★ D16 72187 D/40 ★EP--36-372
Partially deacylated N-acyl ganglioside(s) and glycolipid(s) - have free amine groups which may be used to couple to solid supports without loss of specific affinity
INST MERIEUX 17.03.80-FR-005891

B04 (23.09.81) A61k-35/30 A61k-39/08
07.03.81 as 400405 (395) (F) FR2403098 FR2422699 FR2403081 S4125492 EP--16702 FR2451194 DE2910509 WP8001875 5.Jnl.Ref (AT BE CH DE FR GB IT LI LU NL SE)

Partially desacylated derivs. of gangliosides or glycolipids having N-acyl groups, having specific affinity properties when they are coupled to solid supports, are characterised in that they have free amine groups which may be shown by a positive reaction in a ninhydrin test, that they are mobile in thin layer chromatography on silica gel developed with 80:32:7 chloroform-

methanol-water and in that they have the specific affinity properties of the gangliosides or glycolipids from which they are derived. The derivatives may be coupled to the solid supports, via the amine groups freed by the partial deacylation, without loss of their specific affinity properties. Specifically claimed gangliosides are GM1, GM2, GD1a, GD1b and GT1. The solid supports may be organic or mineral materials, such as opt. modified organic polymers or porous mineral bodies modified by addition of groups capable of coupling with the free amine groups.

Isolation and purification of biological macromolecules, such as hormones, viruses, interferon, bacterial toxins etc. e.g. GM1 may be used for cholera toxins and thermolabile enterotoxins secreted by *E. coli* etc; GD1a, GD1b or GT1 may be used to fox tetanus toxin, which is purified to produce an improved anti-tetanus vaccine and GM2 may be used to isolate interferon for anti-viral and anti-tumour used. The present invention allows production of active groups on the gangliosides and glycolipids so that they may be fixed to solid supports without loss of their specific affinity. (28pp)

Appts. for mixing two fluent materials - with flexible diaphragm deformable to control rate of supply of one material
SCOTTISH AND NEWCA 14.06.77-GB-024696
J01 Q66 (30.09.81) B01f-05 B01f-15/04 F16k-07/07
24.05.78 as 024696 (295BJ)

Two fluent materials are mixed using an apparatus which includes a duct within which is mounted an inner duct. The first material passes through the inner duct while the second material passes through the space between the two ducts. The outlet of the inner duct is arranged so that any of the first material passing through it mixes with any of the second material through the space. A deformable fluid-tight membrane is positioned within the space and is connected to a pressure control device for deforming the membrane so that the cross-sectional area of the space can be adjusted to control the flow rate of the second material.

The appts. is intended for mixing a sediment, e.g. precipitated during fermentation of a wort in a brewing process, collecting at the bottom of a tank, with clear liquid from above the sediment. (7pp)

B04 (17.08.81) C12n-09/02 C12r-01/80

phosphorylase (PNP), adenosine-aminase (ADA) or guanase (GUN) present in blood, erythrocyte hemolysate or culture soln. and consists of (1) substrate soln., (2) coupler soln., (3) enzyme soln., and (4) reaction-stopping soln.

Soln. (1) is a buffer soln. contg. 0.05-0.2 mol of substrate and sodium azide as the inhibitor for catalase and as antiseptic. Substrate is inosine for PNP, adenosine for ADA and guanine for GUN. pH 7-8 for PNP and ADA and 6-7 for GUN. Soln. (3) is a buffer soln. of pH 6-8 contg. 0.05-0.2 mol of 3-(p-iodophenyl)-2-(p-nitrophenyl)-5-phenyl-2H-tetrazolium chloride or 2,2'-di-p-nitrophenyl-5-5' diphenyl-3-3'-(3,3'-dimethoxy-4,4' diphenylene) ditetrazolium chloride and nonionic surfactant (e.g. Triton X-100) or cow serum albumin as the solubiliser for formazan. Soln. (3) is 1.5-4 mol ammonium sulphate soln. or 40-60% glycerin soln. contg. xanthine-oxidase (XOD) or XOD and PNP. Soln. (4) is an aq. 0.1-0.3 mol citric acid soln. aq. 0.1-1N HCl or 0.1-0.5 mol acetic acid soln.

A simple exact method for determin. of PNP, ADA and GUN is provided which uses XOD as the conjugating enzyme in the final stage of the reaction and measuring the colour of the formazan formed by the reaction with tetrazolium salt. It has been found that ADA-activity is increased by myelogenous leukemia and hepatitis, PNP activity is increased by lymphocytic leukemia and hepatitis and GUN-activity is increased by liver disease. (5pp)

MARU-★ D16 72455 D/40 ★ J5 6102-798
Reagent for determining pepsin activity - comprises blue dextran in casein

MARUHO KK 16.01.80-JP-004002
B04 (17.08.81) C12q-01/38 G01n-21/78
16.01.80 as 004002 (5BZ)

The reagent contains blue dextran in acid-coagulating protein as inclusion prod. Pref. acid-coagulating protein used is casein. The inclusion prod. is prepd. by (a) dissolving blue dextran 3% in 0.1M tris-buffer soln. (pH 10.7), (b) adding to (a) soln. 4.8% casein in the same buffer soln., (c) adding 1N hydrochloric acid to adjust the mixt. pH to 2.0, (d) centrifuging the mixt., (e) washing thus sepd. ppte. with citric acid-physiological salt soln. (pH 2.0) repeatedly until the top clear is free of blue colour, (e) washing the ppte. with acetone several times and (f) drying it. Thereby refined casein-blue dextran inclusion prod. can be obtd.

The inclusion prod. and excipient are mixed uniformly in equal amts. and the mixt. is moulded to 100 mg tablets. When the inclusion prod. in clot form and pepsin are put in strongly acidic soln. of pH 2.0, the included blue dextran is slowly dissolved out with the decompsn. of the protein. Thus, by measuring the colour of the soln. the activity of pepsin can be simply determined. (3pp)

L-Asparaginase (I) is produced by a *Fusarium*. In an example, *F. oxysporum* IFO 9660 (FERM-P 1839) *F. roseum* IFO 5421 *F. solani* IFO 8488

cultured at 28 for 6 days in a medium contg. dextrin 3, soybean casein 6, KH₂PO₄ 0.5, K₂HPO₄ 0.15, and MgSO₄·7H₂O 0.05%. Prodn. of (I) were 3.46, 3.77, 2.71, 3.98, 3.09 and 2.13 units/ml. (I) was pptd. with Me₂CO from the culture filtrate, desalted with Sephadex G-25, and fractionated with DEAE-cellulose chromatography. (J49094889) (5pp)

KANE D16 54519 C/31 = J8 1038-193
Enzyme-contg. membrane prodn. - by dissolving w-33 raw material for silk in aq. solvent contg. alkaline earth or alkali metal salt and dialysing

KANEBO KK 15.12.78-JP-156011

B04 (D13 D17) (04.09.81) *J55081-589 C12n-11/04

15.12.78 as 156011 (33HM)

Enzyme-contg. membrane comprises an enzyme (0.2-20 w/w%) and fibroin (80-99.8 w/w%), the percentage of water content in the membrane being 50-400%. Prodn. comprises (i) dissolving raw material for silk in an aq. solvent contg. 5-80 w/w% alkali metal salt or alkaline earth metal salt; (ii) dialysing the soln. to give a fibroin soln.; (iii) adjusting the soln. to a concn. of 0.5-20 w/w%, (iv) adding an enzyme and a water-soluble cpd.; (v) submitting the resultant soln. to membrane formation; and (vi) washing the membrane with water.

Examples of enzymes alpha-amylase, ribonuclease, etc. Raw material for silk is e.g. cocoon, raw silk, waste silk. Alkali(ne)earth metal salt is e.g. LiCl, NaI, Mg(NO₃)₂, Zn(NO₃)₂. Water-soluble cpd. is ethylene glycol, PVA, carboxymethyl cellulose, etc. Membrane formation is effected by keeping soln. of fibroin, enzyme and water-soluble cpd. at 5-80 deg.C, pref. 10-60 deg.C, with introduction of air. Obtd. membrane has thickness 20-1000 microns, pref. 50-800 microns, esp. 100-500 microns. The percentage of water in the membrane should be 50-400%, so that good enzymatic reaction and excellent membrane strength are obtd. (J55081589) (7pp)

BAYL- D16 24041 C/14 = J8 1038-196
Determn. of gram-positive and gram-negative bacteria - by treatment with chelating agent pref. an EDTA salt and dye, both components being effective above pH 7.0

BAYLOR COLLEGE MED 27.04.79-US-033900 (25.09.78-US-945197)

B04 S03 (04.09.81) *DE2938-511 C12q-01/04

22.09.79 as 122508 (RH)

Prepn. (I) for colouring bacteria at pH greater than 7.0 contains (a) a chelate forming agent, effective at pH greater than 7.0; (b) a dye suitable for colouring bacteria at pH greater than 7.0. Process for the determn. of bacteria in fluids comprises (i) colouring the bacteria with (I), and (ii) concentrating the bacteria so that the dye associated with the bacteria is clearly visible. The intensity of the colouration of the bacteria is then opt. compared with a known standard.

Process for determining the sensitivity of bacteria towards antimicrobials comprises treating the bacteria with an antimicrobial agent and then treating the bacteria with (I) as above in steps (i) and (ii) and comparing the relative intensity of the colouration of the conc. bacteria as a measure of the relative effectiveness of the antimicrobials.

Process for the differentiation between gram negative and gram positive bacteria comprises treating the bacteria with (I) as above in step (i) and then depositing the bacteria on a semipermeable membrane, the pore size of which is sufficient to hold back the bacteria and which absorbs no significant amts. of free dye and finally washing the membrane with an organic acid of pH 2.5-2.6.

(I) allows the rapid, simple, cheap and accurate determination and analysis of bacteria in body fluids and other fluids or liq. samples. Living gram negative and gram positive bacteria are both coloured. The coloured bacteria concentrates are easily visible and can be recognised without a microscope by people not specially trained. (J55045400) (15pp)

PFIZ D16 36923 C/21 = J8 1038-197
Determn. of Minimum Inhibitory Concn. of antimicrobials - by accurate, rapid and economical measurement system

PFIZER INC 15.09.78-US-942683

B04 S03 T01 (04.09.81) *EP--10-846 C12q-01/18

4.09.79 as 118674 (RH)

Minimum inhibitory concn. (MIC) of an antimicrobial agent (I) against a sampled micro-organism is determined by first distributing a portion of the micro-organism to a growth medium in at least 2 separate chambers. A first concn. of (I) is then distributed to a first chamber and a second different concn. of (I) to a second chamber, and the growth of the micro-organism in the chambers is determined after a predetermined incubation time. This is done by measuring the numerical concns. of micro-organisms in the chambers as compared with a control without (I). These first and second values are used for determn. of MIC as follows: MIC = (first value / second value) × (second concn. of (I)). (J55058099) (41pp)

13.03.81 as 301060 (478BJ) (-) No-Citns. E(AT BE CH DE FR GB IT LI LU NL SE)

Carbohydrate (I) soln. is dried as follows: (a) the (I) soln. is mixed with recycled dry solid prod; (b) the resulting particulate mixt. is dried in a dielectrically heated drying zone to afford an anhydrous prod. which is discharged, and a portion is recycled to (a).

(I) is pref. fructose, dextrose, sucrose, total sugars from sugar cane or sugar beets, or sugar cane or beet molasses. Soln. is pref. water with (I) content pref. at least 85% by wt. Step (a). Amt. of recycled solid (I) is 5-50 pts/pt of solids in soln. Particle size of recycled solid (I) is pref. 50-500 microns. The granular mixt. of (I) soln. and recycled (I) solids pref. has water content not more than 4% by wt. Granules with water-content not above 1% have max. dia. ca 8 mm; and with water-content 1-4% granules have max. dia. 4-7 mm. Step (b). A suitable apparatus is a microwave fluidised bed dryer (US 3528179), which is described in detail.

The method affords dried, solid, particulate (I) prods. which are stable to storage. Process is economical, and may be used to prepare solid prods. from (I) which are difficult to crystallise. (38pp)

CORP * D17 72356 D/40 *GB 2072-209
Starch and protein recovery from starch bearing materials - with reuse of part of process water

CPC INTERNATIONAL INC 25.03.81-GB-009280 (26.03.80-GB-010226)

(30.09.81) A23j-01 C07g-07 C13l-01

25.03.81 as 109280 (955DH)

In a first stage (i) aq. slurry of the comminuted material is formed and then (ii) a starch rich fraction is separated from the greater part of the other components of the slurry. Then (iii) the starch fraction is washed in at least one stage to give a slurry of required purity, fresh water being introduced at stage (iii) and

fractions, of which the first has a lower content of bath soluble and insoluble matter and is recycled for use with fresh water in step (III).

The modification is esp. useful in the sepn. of corn starch and protein. It enables the starch washing steps to be carried out at higher dilution to give a purer prod. without increasing the amt. of water used, which eventually has to be disposed of as light steep water. Alternatively, the use of water can be reduced, and a smaller quantity of more conc. steep water produced, without reduction in the purity of the starch produced. (15pp)

SANK- ★ D17 72934 D/40 ★ J5 6105-748
Drying agent for fermented molasses - obtained by mixing starch with calcined lime, generates heat

SANKYO YUKIKK 24.01.80-JP-008039

(22.08.81) B01d-53/26 B01j-20/24

24.01.80 as 008039 (51NS)

The agent is obtd. by mixing a starch (I) with calcined lime. In (I) calcined lime ratio 1:5.

(I) is wheat flour or rice powder. When the drying agent is mixed with waste fermented molasses, the starch substance absorbs a large amt. of water from the waste molasses. The absorbed water reacts with the calcined lime to generate heat. The waste molasses are self-heated and hence dried.

No external heat is required. (2pp)

Leather stretching and drying device - applying radial pull on periphery and radiant heat

DOKOUPIL J 15.03.80-DE-010003

(23.09.81) C14b-01/26

12.03.81 as 101832 (39HM) (G) No-Citns. E(AT BE CH FR GB IT LI NL SE)

The area of pieces of leather or hides is enlarged and dried by placing elastic foils on both sides and by applying a vacuum to the space between. Forces, applied in the plane of the two foils, enlarge their area and that of the leather. Heat energy (infrared radiation, contact or high-frequency) is added if the pieces are to be dried.

Two foils enclose the piece of leather. A seal near the rim makes the space airtight so that a vacuum can be applied. Ropes are attached to the rims and are used to stretch the assembly by hydraulic cylinders. Infrared radiators supply the heat input. Chains can replace the ropes. (9pp)

 Prodn. of oiling compsn. for leather - by treating mixt. of polyfunctional fatty cpds. and fatty tallow acids with sulphur-contg. cpds.

LEATHER SHOE IND 04.01.79-SU-731215
 E17 (07.01.81) C14c-09
 04.01.79 as 731215 (70VE)

Leather oiling mixt. is prepd. by treating polyfunctional oxygen-contg. 17-25C aliphatic cpds. (I) with non-saponified sulphur-contg. cpds. Cpds. (I) are obtd. by deep catalytic oxidn. of fatty acids and side-products of their mfr.

The emulsifying properties of the above oiling compsn. are enhanced and the mfr. cost is decreased by subjecting to the sulphuration treatment a mixt. of (I) with fatty tallow acids (II) in the wt. ratio of 20:80 to 80:20.

Cpds. (II) are obtd. from sulphate soaps; they are inexpensive. They have a high content of unsatd. bonds which are capable of reacting with sulphur cpds. forming highly active emulsifiers. Conc. H₂SO₄ is used in an amt. of 25-35 wt.% w.r.t. the above mixt. Bul.1/7.1.81 (3pp)

 19.07.76 as 384260 (GW)

Leather is produced by pickling, tanning, neutralising, after-tanning and dubbing in non-polar, water-immiscible organic solvents, e.g. chlorohydrocarbons and fluoro chlorohydrocarbons. The unhaired pelts contain 50-80 wt.% water.

Appearance and hand of leather is equal to that of leather tanned by standard processes. Formation of polluting waste waters is avoided. Consumption of chemicals is reduced. Low water content of leather shortens drying time. Power consumption is saved.

Pickling, tanning and other chemicals may be added directly or preliminarily dissolved or dispersed in organic solvents, but not in aq. solns. Specifically, the unhaired pelts are treated with aq. solns., by standard process, up to and including pickling, followed by centrifuging, squeezing or draining before tanning, neutralising, after-tanning and oiling. 05.03.81 as 300921 (478AT) (E) No-Citns. E(AT BE CH DE FR GB IT LI NL SE)

Compsn. for prepg. permanent dental restorations consists of (by wt.): (a) 25-80 pts. of a mixt. contg. 50-85% of Me methacrylate (I) and 15-50% of one or more polyethylenically unsatd. crosslinking monomers (II); (b) 20-75 pts. of a mixt. of an organic polymeric particulate substance (III) and an inorganic particulate substance (IV) (both insol. in the liq. monomer system (a)); and (c) a redox initiator system.

When used the compsns. pref. afford restorations of min. compressive strength 30,000 psi and/or rotary wear value at least 20 hr/25.4 microns. Prefd. (III) contain F, e.g. poly(ethylene-co-chlorotrifluoroethylene) or poly(vinylidene fluoride), and have particle size pref. 25-75 microns. Pref. (IV) are hydroxyapatite or stearate-coated CaCO₃, and have particle size pref. 0.075-90 microns. Wt. ratio (III):(IV) is pref. 1:1-5, esp. 1-2:3.

The compsns. are useful for prepg. permanent dental restorations (esp. crowns) having high compressive strength and wear resistance. The restorations may be prepd. rapidly. (17pp)

table oil-in-water emulsion - for cosmetic and pharmaceutical use

L'OREAL SA 24.03.80-FR-006468

A96 B05 E19 (30.09.81) A61k-07

3.03.81 as 009022 (476BZ)

An oil-in-water emulsion in which the emulsifying system comprises (i) a mixture of one or more monoalkyl and/or dialkyl carboxylates of one or more alpha-methylglucosides with one or more monoalkyl and/or dialkyl carboxylates of one or more alpha-methylglucosides polyoxyethyleneated with 10-30 mols. of ethylene oxide, the alkyl radicals being 11-21C linear or branched alkyl radicals; (ii) lecithin; (iii) egg yolk oil; and (iv) a water-soluble acrylic acid polymer, is new.

Known emulsions contg. (i) have good unctuousness and spreadability and a substantially gel-like texture but they lack storage stability esp. when exposed to heat. The present emulsions overcome this disadvantage and may be preserved at temps. of the order of 50 deg C. They also have distinctly greater stability than similar emulsions not contg. the particular

combination of ingredients (i), (ii), (iii) and (iv) all of which constituents are necessary for the stability of the present emulsions. These emulsions can be used in cosmetic creams, etc. and also in pharmaceutical excipients for creams, balms and ointments. (8pp)

BEIN/ ★ D21 72359 D/40 ★ GB 2072-215
Floating soap - with pockets of air or gas incorporated to reduce bar density below one

BEINY D H M 19.03.80-GB-009250

(30.09.81) C11d-17/02

19.03.80 as 009250 (1358AS)

Floating soap is made by incorporating air or other gas into a bar in pockets sized such that overall bar density is less than that of water. The pockets may be enclosed in a plastic or waterproof membrane to prevent water seeping in or the air may be contained in sponge material.

Some or all pockets may be filled with liquid, still leaving average density below 1. The soap may be of any size, shape or colour, and is easier to retrieve if dropped into water. (2pp)

SNKM ★ D21 72409 D/40 ★ J5 6102-540
Nickel alloy for dental use - contains cobalt, chromium, molybdenum, copper, silicon, and carbon

SANKIN KOGYO KK 17.01.80-JP-004248

M26 (17.08.81) A61k-06/04 C22c-19/05

17.01.80 as 004248 (32DH)

Ni alloy for dental use comprises Co 3-42%, Cr 5-30%, Mo 2-18%, W 0-10%, Cu 0-10%, Si 0.1-3%, C 0.01-0.5% and the balance Ni and impurities.

This Ni alloy is suitable as a cast bed of dental use. The alloy has a relatively low m.pt. owing to the Mo, Cu and Si contents in the stated ranges, so that the alloy can be cast in a mould including a plaster insert. The cast prod. has a good surface without sintering onto the mould or insert. Typically the m.pt. is 1340 deg. C, the hardness is 300 Hv, the bending resistance is 118 kg/sq. mm, the max. bending is less than 20 mm and the elasticity limit is 65 kg/sq. mm.

KURS ★ D21 72505 D/40 ★ J5 6103-103
Dental cavity-sealing agent - contains polymerisable methacrylate monomer mixt. filler and hardening agent of polymerisation catalyst and initiator

KURARAY KK 21.01.80-JP-005983

A96 (18.08.81) A61k-06/08

21.01.80 as 005983 (42RP)

A dental cavity-sealing agent (I) consists of (1) polymerisable methacrylate monomer-mixt. of 1,2-bis(3-methacryloxy-2-hydroxypropoxy) ethane (II), 2,2'-bis(4-(3-methacryloxy-2-hydroxy propoxy)phenyl)propane (III), neopentyl glycol dimethacrylate (IV) and triethylene glycol dimethacrylate (V), (2) filler (VI) and (3) polymer-hardening agent composed of polymerisation-catalyst (VII) and polymerisation-initiator (VIII).

Since the viscosity of (I) is low in comparison with those of other known (I), it easily penetrates into small dental cavities and adhere tightly to the surface of the cavities. (VII) and (VIII) should be packaged separately, and mixed just before use. The volume ratio of the component (1) to the sum of (1) and (2) is 30-50%. The wt. ratio of the component (3) to the component (1) is 0.1-6%. The contents of (II), (III), (IV) and (V) in the component (2) are 10-20 wt.%, 51-60 wt.%, 10-20 wt.% and 10-17 wt.% respectively. (6pp)

Yellowish red make-up cosmetic - comprises cation exchange clay on which rhodamine B, polyvalent metal salt and, water soluble polymer are adsorbed

SHISEIDO KK 19.01.80-JP-004989

A96 (18.08.81) A61k-07/02

19.01.80 as 004989 (42PW)

Yellowish red cosmetic (I) contains cation-exchange clay (II), on which rhodamine B(III), polyvalent metal salt (IV) and water-soluble polymer (V) are adsorbed, is new.

Montmollironite, zeolite, kaolin, halosite, etc. are used as (II). Examples of (IV) are chlorides and sulphates of Cu, Ba, Zn, Mg, Mn, Al etc. As (V), gelatin, casein, starch, vegetable gums, gums from sea weeds, methylcellulose, CMC, PVA, polyethylene oxide, etc. are listed. The amt. of (V) used should be 1-50% per that of (II). (5pp)

SEIW. ★ D21 72508 D/40 ★ J5 6103-106
Hydrolysed keratin- contg. hair treatment compsn. - to protect hair during permanent wave treatment

SEIWA KASEI KK 21.01.80-JP-005508

A96 (18.08.81) A61k-07/09

21.01.80 as 005508 (42RH)

An agent (I) contg. hydrolysed keratin (II) as principal component is new. Permanent-wave treatment is effected as follows; (1) hair is treated with an aq. soln. of a reductant such as thioglycolic acid or cystein, after being curled around curling rod and then (2) hair is treated with a neutral aq. soln. of an oxidant. Thus, disulphide linkages in cystein contained in keratin of hair are reduced and cleaved by the treatment (1), and then new disulphide linkages are regenerated by the oxidn. in the treatment (2). During such permanent-wave treatments, a part of the disulphide-linkage remains unregenerated or excessively oxidised, resulting in that hair becomes dry. When hair is treated with (I) before permanent wave treatment, the above damages of hair are prevented.

When hair is treated with (I), (II) adheres on the surface of hair. The mol.wt. of (II) is pref. 300-500. The other components in (I) are solvent (water or alcohol), chelating agent, pigment, perfume, pH-controlling agent, etc. (6pp)

SHIS ★ D21 72748 D/40 ★ J5 6104-807
Stable cosmetic having excellent feel, colour tone etc. - contains esterified prod. obtd. from polyhydric alcohol, fatty acid and di:basic acid, for face creams etc.

SHISEIDO KK 24.01.80-JP-007302

E17 (20.08.81) A61k-07

24.01.80 as 007302 (5RP)

Cosmetics contg. at least one esterified prod. are obtd. by esterifying the components (a), (b) and (c). (a) Polyhydric alcohol. (b) One or more cpds. selected from above 8C straight fatty acid, branched fatty acid, unsatd. fatty acid and hydroxy fatty acid. (c) Above 12C opt. branched dibasic acid, of which amt. is above 1/2 fold in mol on polyhydric alcohol.

The esterified prod. (oligoester) is excellent as cosmetic base and obtd. cosmetics (e.g. cream, milk lotion, lipstick, foundation, cosmetique, pomade, shampoo, etc.), are excellent in colour tone, flavour, stability, feeling at use and uniformity in quality. The oligoesters have excellent affinity to skin, adhesive property to skin, humidity-holding properties, stability, etc. (7pp)

 22.03.73 as 172806 / 79 Div.ex. 032904/73 (15DJ)
 The compsn. of anticorrosive fillers for coating fine crevices on serrated surface comprises a homogeneous blend which consists of silicic acid having a fine granular dia. 1.0-100.0 microns and (alpha)-cyanoacrylate.
 The alpha-cyanoacrylate is a lower alkyl ester of alpha-cyanoacrylic acid, e.g. (m)ethyl ester, n-propyl, isopropyl, n-butyl acid or isobutyl ester.
 The silicic acid particles having the fine granular dia. of 1.0-100

silicic acid particles is mixed with a balance wt. % of the lower alkyl ester of alpha-cyanoacrylic acid to obtain a thixotropic mixt. The compsn. of anticorrosive fillers produced above is mixed with DMF to obtain a coating compsn. The serrated surface is first cleaned with an acid and the serrated surface is coated with the above compsn. where the acid is chosen from phosphoric or citric acid. (J55105608) (3pp)

OREA D21 14189 B/08 = US 4289-49
Hair colouring compsn. contg. oxidn. dyes - and 2,5-di:hydroxyphenyl alkanolic acid cpds.

 13.11.78 as 959623 (+ 1.4.77-US-783632) (924RP)
 Hair setting lotion comprises in a hydroalcoholic soln. a copolymer obtd. by the polymerisation of (a) a water-insoluble monomer of formula
 $\text{CH}_2\text{:C(R1)CONH(R2)C(R3)(X)nR}$ (I)
 and (b) a water soluble monomer of formula
 $\text{R4CH:C(R5)(CH2)mCON(R1)zOH}$ (II)
 The copolymer has a mol.wt. of 1000-500,000 and is present in an amt. of 0.3-6 wt.% of the lotion.
 In the formulae R is 1-10C alkyl; R1-3 are each H or methyl; n is 0 or 1 and when n is 1, x is 0; R1 is H or methyl; z is 1-6C alkylene opt. substd. by 1-2 hydroxymethyl gps.; m is 0 or 1; when m is 0, R4 is H or -COR6 (where R6 is OH or -NHR7; R7 is H or -Z-OH) and R5 is H or -CH3; and when m is 1, R4 is H and R5 is -COR6.
 The novel copolymers with a base of N-alkyl (meth)acrylamide and also useful in lacquers, nail polish etc. They have improved brilliance and good adherence etc. (9pp)

MONS D21 73163 A/41 = US 4289-753
Dental plaque inhibiting compositions - contg. bis-carboxy-alkoxy-butane di:carboxylic acid deriv. e.g. 2,3-bis-carboxy-methoxy-butane di:carboxylic acid tetra:sodium salt
MONSANTO CO 04.04.77-US-784188
B05 E17 (15.09.81) *DE2814-298 + A61k-09/68
 04.04.77 as 784188 (924RP)
 Oral compsn. for inhibiting formation of dental calculus, comprises (1) a bis(carboxyalkoxy) butanedioic acid cpd. of formula (I) and (2) a suitable carrier. In (I) each R is H or lower alkyl. The compsn. is suitable for oral hygiene prods. and chewing gums.
 Pref. oral compsn. is toothpaste having a pH of 4-11, the concn.

of (I) being 0.1-5 wt.% of the compsn. (I) may be used in the form of alkali metal or ammonium salts. Typical toothpaste contains 31.58 pts.wt. water, 6.25 pts.wt. sorbitol, 0.12 pts.wt. saccharin, 39 pts.wt. Ca pyrophosphate, 18 pts.wt. glycerine, 0.4 pts.wt. Na alkyl (coconut) sulphate, 0.75 pts.wt. Na coconut monoglyceride sulphonate, 1.15 pts.wt. Na CMC, 0.40 pts.wt. Mg Al silicates, 0.85 pts.wt. flavouring and 1 pt.wt. BCMBDA. The compsn. has a pH of 5.9. (5pp)

RICH- ★ D21 73604 D/40 ★ US 4289-754
Mouth-wash contg. fluoride cpd., carrier - and alkali metal or ammonium zinc citrate

RICHARDSON-VICKS IN 03.11.80-US-203520

B05 E12 (E34) (15.09.81) A61k-07/16

03.11.80 as 203520 (985NS)

A mouthwash contains 0.01-1.0 wt.% of an anticaries effective fluoride cpd. (I), 0.1-15 wt.% ammonium or alkali metal zinc citrate and a carrier. Pref. (I) is sodium fluoride, potassium fluoride, stannous fluoride or sodium monofluorophosphate. The citrate is pref. sodium zinc citrate and is present in amt, 0.2-5.0, esp. 0.5-2.0 wt.%. The carrier is pref. 5-40 wt.% EtOH 0-20 wt.% humectant, 0-12 wt.% surfactant, 0-0.5 wt.% sweetener, 0-0.3 wt.% flavouring and balance water.

The Zn cpds. are useful for controlling calculus but are less astringent than Zn chloride and so the compsn. has improved anti-odour activity c.f. compsns. contg. Zn chloride. They also

have higher aq. solubility than Zn citrate and do not present any chemical incompatibility problems with the fluoride salt. (4pp)

RICH- ★ D21 73605 D/40 ★ US 4289-755
Stable mouth-wash contains zinc citrate, sodium fluoride - alkali, a carrier and citric acid to solvate the citrate

RICHARDSON-VICKS IN 03.11.80-US-203634

B05 E12 (E34) (15.09.81) A61k-07/16

03.11.80 as 203634 (985)

Mouthwash compsn. contains 0.1-15 wt.% zinc citrate; 0.01-1 wt.% sodium fluoride; citric acid to solvate the Zn citrate; alkali to pH 6.0-7.2; and a carrier. The carrier is pref. (by wt.) 5-40% EtOH, 0-20% humectant, 0-12% surfactant, 0-0.5% sweetener, 0-0.3% flavouring and balance distilled water.

Pref. the citric acid is present in amt. 1.5-10, esp. 2.5-3.5 partic. 2.76 moles per mole Zn citrate. The alkali is pref. an alkali metal or ammonium hydroxide esp. NaOH.

Zn citrate is useful for controlling dental calculus and mouth odour and is less astringent than Zn chloride and so (i) does not reduce anti-odour activity, (ii) is not chemically incompatible with NaF. (3pp)

Patients, who have undergone an ostomy (colostomy, ileostomy, ureostomy) and are estimated to number 100000 in Germany alone, have to use a bag for excreta or urine. A new material for such bags which disintegrates in an aqueous medium, is laminated. The first (inner) layer is 2-20 (3-8) mmicrons thick and is water insoluble, i.e. a thermoplastic (polyethylene) foil, hot melt layer or waterproof paper. The second layer is 10-100 (20-40) mmicrons thick, water soluble and made of polyvinyl alcohol or partly saponified polyvinyl acetate. The outer layer is 30-150 (40-100) mmicrons thick, hydrophilic and consists of Kraft paper.

The outer layer becomes detached by soaking in the W.C. bowl and the middle layer dissolves. The thin innermost layer is then lacerated when it is flushed away, thereby eliminating stoppages by the conventional PVC bags. (7pp)

16.05.78 as 019855 (974PW)

Medical compsns. have a consistency which permit them to be shaped by hand. They comprise a homogeneous mixt. of mineral oil and a premix at a wt. ratio of 1-10:3.5-10.

The premix is a homogeneous mixt. of (i) 40-60 wt.% of a pressure-sensitive adhesive component and (ii) up to 60 wt.% hydrocolloid gum(s) (I) or up to 60 wt.% cohesive strengthening agent(s), (II) or 40-60 wt.% of their mixt. (I) is up to 40 wt.% guar gum and/or locust bean gum and 0-25 wt.% of pectin and/or gum karaya. (II) is finely divided cellulose, finely divided water insoluble crosslinked dextran, finely divided water insoluble NaCMC or finely divided water insoluble starch-acrylonitrile graft copolymer.

Compns. are used for mounting appliances on abdominal stoma. (10pp)

Removing adherent contamination from contact lenses - by soaking with soln. contg. hypohalite

TOYO CONTACT LENS 23.02.80-JP-021077

E36 P81 (30.09.81) G02c-13

12.02.81 as 104366 (955RH)

Contaminants on the surface of contact lenses are removed by immersion in a soln. contg. a salt of a hypoalogenous acid.

The treatment removes even proteinaceous deposits that are left by other treatments.

The soln. may contain alkali or alkaline earth hypochlorite hypobronites or hypodites. Hypobronite may be prepf. in situ by reaction of the corresp. bromide and an active chlorine source e.g. Na salt of N,N-dichlorotaurine, Ca hypochlorate etc. The concn. of the soln. may be 1-20,000 ppm, and treatment time mins. -24 hrs-1-50 ppm and 3-24 hrs is pref. The compsn. may be provided in the form of a soln, as a concentrate that is diluted, or as a tablet, or powder which is dissolved in water. Treated lenses may be immersed in a soln. of reducing agent e.g. thiosulphate salts ascorbic acid, reducing sugars, to destroy residual hypohalite. (5pp)

22.01.80 as 006219 (26DH)

Device is claimed for deodourising or pasteurising dirty air by using a cleaning liq. contained in a tank. The tank is partitioned by a vertical wall into two chambers; one having an air inlet at the top and the other having an air outlet provided with a suction fan. The lower end of the vertical wall extends down to the surface of the cleaning liquid.

A round pipe is horizontally attached at the lower end and is covered with an arched cover located at the other chamber having the outlet, so that the air is mixed with the liquid in the space defined by the pipe and cover and the mixture is guided into a dessicator case located in the other chamber. The air is effectively contacted with the cleaning liq. (2pp)

Structures protection against fungal attack - by applying water or ethanol soln. of pyrocatechin

GERASIMENKO A A 26.03.79-SU-742459
E14 Q43 (15.01.81) E04b-01/72

26.03.79 as 742459 (1462WD)
Pyrocatechin is non-toxic to man and an effective fungistatic agent for protecting construction materials from damage by microorganisms, e.g. microscopic fungi.

In order to use it as a fungistatic agent for protecting constructions, 0.05% solns. of pyrocatechin in water or ethanol are made up. They are then applied by brush or sprayed on to the surfaces of the constructions to be protected. The solvent gradually evaporates, leaving the fungistatic substance on the uneven surface of the construction, which it protects from damage by microscopic fungi.

The use of this fungistatic agent suppresses the development of viable (active) microscopic fungi already present on the construction to be protected and also prevents their development should further spores or mycelium reach the surface of the construction. Bul.2/15.1.81 (2pp)

05.10.79 as 082352 C.I.p4199367, 4136697 (+ 7.11.75, 22.4.77-US-629952, 790129) (AT)

Article, esp. a surgical dressing or tampon, comprises a highly fluid absorbent mass of alloy rayon staple fibres consisting of a matrix of regenerated cellulose and 10-40 pref. 15-35 wt.% of Na CMC (on wt. of cellulose), at least 75% of the carboxyl gps. in the CMC being in salt form. The fibres are 1.5-6 denier and carry less than 1% of a lubricating or protective finish. Fluid holding capacity is at least 5.5 cc/g fibre as measured by the syngyna test.

The lubricating or protective finish is pref. a nonionic polyoxy ethylene sorbitan monoester of a higher fatty acid and is used e.g. at 0.1-0.5%. The fibres are prepd. by adding CMC to viscose, spinning the mixt. into fibre form into an acid bath, e.g. contg. sulphuric acid, Na₂SO₄ and usually ZnSO₄ at 80-55 deg.C, washing to remove acid, desulphurising and treating with a lubricating finish. The fibres are suitably chemically crimped.

CMC with D.S. above 0.35 (0.4-1.2) may be used even though it is water-soluble, as it is prevented from going into soln. by the cellulose matrix. (4pp)

An inflatable pad, to exert pressure on large areas of skin which have been transplanted in plastic and reconstructive surgery, consists of two rectangular foils of latex or an elastic plastic material to suit the transplant which are joined at the periphery by a tight seam. The lower foil has a central cut-out, slightly larger than the transplant and is bonded by adhesive to the skin of the patient. The top foil includes a valve through which the pad can be inflated. The top is transparent for visual observation.

This prevents the sweating under the usual rubber pads. The new pad throws no folds and allows oxygen or a nutrient solution to be applied to the transplant. (17pp)

Pad to exert a pressure on large areas of transplanted skin consists of two foils, made of latex or an elastic plastic material, which are joined at the edges by an airtight welded seam. The top foil includes a valve for inflation with air or a liq., and a bonded stiff plate which resembles the curvature of the limb on which the transplant has been applied.

This stiff plate is also made of plastic material and is rigid and large enough to exert a uniform pressure on the transplant. This pad prevents folds from forming (which remain visible after complete healing). (13pp)

3- or 4-formyltricyclo-(5,2,1,0(2,6))-decene-8 is prepd. by
contacting dicyclopentadiene with CO and H₂ in the presence of a
Rh catalyst at 110-150 deg.C and 50-400 atmos.

The catalyst is present in amt. 1-30 ppm of Rh w.r.t. the amt. of
dicyclopentadiene used, and is in the form of an organic
phosphine-CO contg. complex. The organic phosphine is an

aliphatic opt. branched-chain, a cycloaliphatic-, an aromatic- or
an arylaliphatic phosphine or a phosphine contg. one or more
subst. cyclic gps., or one contg. 2P or more and 1-30C.

The prod. is esp. used in perfume and fragrance compsns., and
as intermediates in the mfr. of synthetic rubber. (3pp)

Deodorising textile washing compsn. - contg. soap, deodorant,
builder and bleach (NL 16.7.79)

LEVER BROTHERS CO 12.01.78-GB-001285

(15.09.81) *DE2900-722 C11d-09/44

15.08.78 as 933931 (964RP)

Deodorant detergent prod. comprises (i) 1-99 wt.% soap; (ii) 0.99-
98.99 wt.% other detergent adjuncts including builder and/or
bleach; and (iii) 0.01-10 wt.% deodorant compsn. comprising 45-
100 wt.% of deodorant active components.

Components (iii) have a lipoxidase-inhibiting capacity of at
least 50% or a Raoult variance of at least 1.1. The components are
classified into 6 classes: (1) phenolic substances; (2) essential oils,
extracts, resins and synthetic oils; (3) aldehydes and ketones; (4)
polycyclic cpds.; (5) esters and (6) alcohols. When component can
be in more than one class it is classified in the lower or lowest
class.

The components are selected so that (a) the deodorant compsn.
contains at least 5 components of which at least one must be from
each class (1), (2) and (4); the compsn. contains components from
at least 4 of the classes; and (c) any component present in the
deodorant compsn. at a concn. of less than 0.5 wt.% is eliminated
from the requirements (a) and (b).

The compsn. has a deodorant value of 0.50-3.5 as measured by
the deodorant value test. The compsn. is used for washing fabrics
which when subsequently worn in contact with human body skin
reduce odours..(13pp)

GB IT NL)

A biocidal aq. wax emulsion, suitable for the care of floors is
made by preparing separately an anionically emulsified wax
emulsion contg. 5-40% by wt. of wax and an aq. soln. of a salt or a
quaternisation prod. of a long chain fatty amine as cationic

and 6-50 mols ethylene oxide. The components are then mixed so
that the final prod. contains 1-20 wt. % wax, 1-10 wt. % biocide and
1-10 wt. % ethylene oxide condensate.

The wax is pref. a polyethylene wax oxidate of mol.wt. 2000-
10000 and acid number 7-70 or a natural or synthetic ester wax of
acid number 5-80 and saponification number 10-40. The cationic
biocide and anionic wax salt form a neutral salt that makes the
emulsion storage stable. (5pp)

Fluorescent whitening dye for detergent - obt'd. by heating triazinyl-amino:stilbene deriv. in presence of aromatic sulphonic acid deriv. and/or surface activator

MITSUI TOATSU CHEM INC 22.01.80-JP-005262

E23 (18.08.81) C09b-57

01.80 as 005262 (136HM)

Triazinyl-aminostilbene deriv. crystal is produced by (1) bis-triazinyl-aminostilbene deriv. salts of formula (I) at 50-100 deg.C in the presence of (2) one or more of aromatic sulphonic acid salt-contg. cpd., anionic cationic surface and amphoteric surface activator, in an amt. of above 0.5% of (1) in aq. medium. Component (1) is synthesised using acetone as the solvent for anuryl chloride or by condensn. in the presence of alkaline with metal carbonate and surface activator in aq. solvent. Component (1) is yellow crystal (alpha-type). Component (1) is mixed with 5-20 times the wt. of water and mixed with above 0.5% (2) and heated at 90-100 deg.C in slightly alkaline state. Component (2) is e.g. anthraquinone-1-sulphonic acid, Na anthraquinone-2-sulphonate, beta-naphthalene-sulphonic acid-maline condensate.

The beta-type crystal is white and, when mixed with detergent, improves the whiteness of detergent and whitens the washed re. (4pp)

ASAG ★ D25 72845 D/40 ★ J5 6105-000
Particulate detergent compsn. - consisting of surfactant, builder comprising sodium potassium carbonate and filler

ASAHI GLASS KK 25.01.80-JP-006764

E34 (21.08.81) C11d-03/10

25.01.80 as 006764 (126AT)

A particulate detergent compsn. consists of a surfactant builder and filler. The builder consists of sodium potassium carbonate. The content of sodium potassium carbonate is 5-40 wt.%. The surfactant pref. consists of a salt of alkylbenzene sulphonic acid or a higher fatty alcohol.

Pref. content of sodium potassium carbonate in the detergent compsn. is 5-40, esp. 15-35 wt.%. Hexahydrate of sodium potassium carbonate is used conventionally. Conventional spray-drying process are used for the particulation of the detergent compsn.

Sodium potassium carbonate is used as the builder in place of phosphate. Pollution e.g. eutrophication of river water etc. due to phosphates is avoided, and satisfactory detergency is obt'd. without using phosphates. (3pp)

SUNP- D25 75924 B/42 = J8 1038-640

Acidic powder cleaner for applying to inside of pipes etc. - contains sodium hydrogen sulphate and/or sulphamic acid, (bi)carbonate as effervescent substance, solidification inhibitor and extender

SUNPOLE KK 27.02.78-JP-020944

E34 (E36) (08.09.81) *J54113-607 C11d-07/10

27.02.78 as 020944 (117AT)

The powder cleaner contains (i) $NaHSO_4$ and/or sulphamic acid as active components. (ii) an effervescent substance e.g., K-Na sodium carbonate, K_2CO_3 , Na_2CO_3 , $NaHCO_3$, etc., (iii) 2.5-50 wt.% a solidification inhibitor, e.g. the same compounds as the aforesaid effervescent substance other than $NaCO_3$ and (ii) an extender, e.g., Na_2SO_4 .

The powder acid cleaner enables one to clean the insides of drain pipe, traps, filter pipes, etc., without the need to remove or disassemble pipe arrangement etc. (J54113607) (5pp)

CONO ★ D25 73037 D/40 ★ RD -209-042
Pumpable amide compsn. for dish-washing foam booster - contains ethoxylated alcohol sulphate(s) and lauric or myristic mono:ethanolamide

CONOCO INC 20.08.81-RD-209042

A97 (10.09.81) C11d-00/*

20.08.81 as -----

Amides e.g. lauric/myristic monoethanolamide (LMMEA) are used as foam boosters in dishwashing liq detergents esp where a high foam level is desired. Normally these materials are solids at room temp and are not readily soluble in water so special handling and heating are required in order to incorporate the LMMEA into the prod.

A blend of LMMEA and ethoxylated alcohol sulphate is pumpable at ambient temp and is temp stable. Because of this, the resulting blend can be used to introduce the LMMEA into the detergent prod. (--pp)

CONO ★ D25 73040 D/40 ★ RD -209-045
Liq. washing agents contg. fabric softener - contg. nonionic ethoxylated alcohol detergent with peaked ethoxy content

CONOCO INC 20.08.81-RD-209045

A97 (10.09.81) C11d-00/*

20.08.81 as ----- (513HM)

The use of peaked distribution ethoxylates (I) in liq laundry formulations contg a fabric softener, esp a quat ammonium salt softener, gives an improvement w.r.t the use of conventional ethoxylates. The (I) is a non-ionic ethoxylated alcohol detergent having a higher concn of the median number of moles of ethylene oxide, a lower amt of one- and two-mole ethoxylates, a lower amt of high mole ethoxylates and a lower unethoxylated alcohol content as compared to conventional ethoxylates. In an example, a conventional ethoxylate (II) of 80% C12 and 20% C14 alcohols and contg 58% ethylene oxide was used, contg 9.5-10% contg 7 moles EO and less than 10% ethoxylates contg 6,7 and 8 moles EO. A peaked ethoxylate (I) was used with the same basic compsns but contg 13.5-14% ethoxylates contg 7 moles ethylene oxide and above 11 moles each of ethoxylates contg 6,7,8 and 9 moles EO.

Fabric softeners used were methyl(1)oleylamidoethyl(a)oleyl imidazolinium methosulphate (III) and dialkyl dimethyl ammonium chloride (IV). The cloud/clear temps (deg F) and viscosities (cp) of compsns comprising 25% ethoxylate, 4% fabric softener, 10% Ethanol and remainder water. were as follows: (II) + (III) 17/26, 133; (II) + (IV), 48/58, 212; (I) + (III), 10/21, 82; (I) + (IV), 40/51, 144. (--pp)

VOLG = ★ D25 73079 D/40 ★ SU-794-001
 Prodn. of alkyl sulphate or sulphonate for detergent mfr. prepn. - by treating higher fatty alcohol or alkyl-benzene with gaseous sulphation or sulphonation agents in film-type reactor
VOLGODON SURFACTANT 05.10.78-SU-669475
E19 (07.01.81) C07c-139 C11d-03/34
 05.10.78 as 669475 (114VE)
 Prepn. of sulphate or sulphonate cpds. by sulphonation or sulphatisation of higher fatty alcohol or alkylbenzene in a film (which is introduced into the top part of the reactor and turned by gas stream of velocity 10-30 m/sec with the aid of asymmetrical vortex-formers situated along the flow path) with gaseous sulpho-agent contg. 6-20 vol. % SO₃ (which is introduced from the top into the central part of the air-flow in the form of a fine jet at rate of 20-100 m/sec into a zone of SO₃ concn below 1 vol. %) and processing in molar ratio (alcohol or alkylbenzene):SO₃ = 1:0.02-1.5 is made more economical by turning the film with reactor-zone exhaust gas (pref. freed of sulpho-prod. droplets and H₂SO₄ fog).
 The process lowers overall air expenditure by 1/3. (2pp)

NOVO = ★ D25 73080 D/40 ★ SU-794-002
 Prepn. of alkyl sulphate detergents - from higher aliphatic alcohol by treatment with sulphuric acid and phosphorus pentoxide and then with alkali
NOVOMOSKOVSK CHEM 09.10.78-SU-672055
E17 (07.01.81) C07c-139/10 C11d-03/34
 09.10.78 as 672055 (1471VE)
 The prepn. of alkyl sulphates is carried out by the treatment of higher fatty alcohols (or primary 10-18C alcohols) with a mixt. of 90-100% H₂SO₄ and phosphoric anhydride in molar ratio alcohol:acid: phosphoric anhydride equal to 1:1:(0.33-1) at 20-40 deg.C, followed by neutralisation of the reaction mixt. with a base.
 The degree of sulphation is 99%. The products do not contain any free alcohols or Na₂SO₄, but contain polyphosphoric sodium salts, which enhance the props. of the detergent compositions. (3pp)

CIBA D25 19949 Y/12 = SU-795-501
 Washing powder compsn. based on nonionic surfactants - contg. organic polymer to improve storage and free-flow properties

*Includes numbered Basics from Week D32 (CPI)

Arrangement of Abstracts

'MAJOR' COUNTRIES – An alerting abstract of every basic document is provided, and of examined equivalents from West Germany, Great Britain, Japan, the Netherlands and the United States, and granted and unexamined European and unexamined PCT equivalents. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

CPI Section Headings

See inside cover for further details.

OTTO- ★ D11 73745 D/41 ★ BE -888-939
Machine for mixing and extruding edible paste for bakery etc. - has volumetric rotor to control flow of mixt. to extrusion screw
OTTOPRAN SRL 22.12.80-IT-005253 (23.05.80-IT-005160)
(16.09.81) A21c

22.05.81 as 888939 (448HM)
Machine for the prepn. of edible pastes etc. The machine is of the type in which the ingredients are premixed in a bowl and then transferred to an extrusion chamber for final kneading and discharge.

The premixed ingredients are now transferred from the bowl to the chamber via a volumetric rotor. The rotor comprises a hub fixed on the inlet end of the extrusion screw shaft and a radial arm with volumetric pumping paddle.

Pref. the mixing bowl agitator shaft, the extrusion screw shaft and the volumetric rotor are coaxially aligned and coupled together. The bowl is pref. equipped with a vertical agitator shaft which extends upwards to be detachably coupled to the screw shaft of an extrusion chamber which can be raised clear of the bowl top with a removable bowl cover.

The machine can pref. be tilted so that the axis of the bowl agitator shaft is inclined to the vertical and premixed ingredients tend to flow by gravity towards the extrusion chamber.

Used for mixing, kneading and extruding edible pastes partic. for bakeries patisseries. The rotor exercised volumetric control over the rate of transfer of premixed ingredients into the extrusion chamber. This prevents overfeeding and blockage of the extrusion screw. No axial back thrust from screw to drive motor. The machine is easy to dismantle and reassemble for frequent cleaning and simple servicing. (15pp)

Flour compsn. is a mixt. of starch diluent - and pptd. protein micellar mass, used as substitute for wheat flour
GENERAL FOODS CORP 21.07.78-CA-307867
(01.09.81) A21d-02/36

21.07.78 as 307867 (955NS)
Compsn. is a mixt. of at least one dry particulate protein micellar mass with a particulate food grade starch material, and contains 5-95 wt.% protein. The protein micellar mass is pref. prepd. as described in CA Pat. 1,028,552. A protein source is treated with a food grade salt soln. of ionic strength at least 0.2, pref. 0.2-0.8, and pH 5.5-6.5, at 15-35 deg.C to cause solubilisation of protein. The soln. is then pref. diluted to an ionic strength below 0.1 to cause pptn. of a sticky viscous mass of micellar protein which may then be dried and powdered. The proteinaceous starting material is pref. a cereal, legume, oil seed, animal protein or microbial protein.

The compsn. is useful as a fully functional extender or replacement for wheat flour in baked goods. (14pp)

Wheat gluten thermal treatment - in cylinders with high-speed horizontal cutter shafts before ascension tube drying
BABCOCK-BSH AG 25.03.80-DE-011377 (00.00.78-DE-812122)
Q76 (01.10.81) A21d-02/38 F26b-03/12

25.03.80 as 011377 Add to 2812122 (39HM)
The thermal treatment of gum-like viscous material such as wheat gluten, produced in the manufacture of wheat starch, was described in the Parent Patent No. 2812122. The pretreatment chamber with the high-speed shaft carrying radial cutter blades is now arranged horizontally. The ascension tube dryer receives the charge from this chamber at its bottom elbow. The chamber is preferably subdivided into two chambers with independently driven cutter shafts.

These changes are better able to ensure a troublefree operation when the properties of the gluten are most awkward and fluctuating. (10pp)

Appts. for simultaneous extrusion of dough ribbons - with flared head contg. conical mandrel limiting ribbon curvature

FRITO-LAY INC 10.12.79-US-101701
 (22.09.81) A21c-11/16 B29f-03/06

10.12.79 as 101701 (295HM)

Dough is extruded through a head which forms it into a plurality of ribbons. The dough is delivered downwardly to the head which has a flare section across the end of which is located a die plate. The plate has orifices corresponding to the number of ribbons to be extruded.

A cone-shaped mandrel is supported in the flared section with its base confronting, but spaced apart from, the die plate. It has a base radius extending at least to the outer edges of all the orifices. The confronting surfaces of the mandrel and the flare section are spaced apart to define an outwardly flared annular flow channel.

The appts. is used to produce extruded dough ribbons which are subsequently cut into individual pieces which can be cooked to form a food prod. The tendency of the extruded ribbons to curl is minimised and possibly completely removed. (6pp)

FERO ★ D13 73747 D/41 ★BE-888-943
Detecting butyric acid generating bacteria in milk - by incubating in sealed container holding culture medium and inert solid

FERROSAN 22.05.80-SE-003859

S03 (D16) (16.09.81) A23c G01n

22.05.81 as 888943 (1251HM)

Appts. for detecting the presence of butyric acid generating bacteria (Clostridium) in milk is a sealed, cylindrical container which has been sterilised in an autoclave and which contains a culture medium (for anaerobic or microaerophilic cultures) and an inert material (I) which solidifies at below 40 deg.C and is less dense than the medium. The milk sample is introduced into the container under aseptic conditions.

Pref. the container is filled with Reinforced Clostridial Medium (RCM) plus a silicone or paraffin of m.pt 56-58 deg.C as (I). Method for detecting these bacteria comprises introducing a milk sample into the container through a removable, sterilised plastic tube, then heating on a water bath at 80 deg.C for 10 min and incubating at 31 deg.C for 4-7 days. The presence of the bacteria is indicated by formation of gas.

This method is more economical, simpler and easier to manipulate than the known Winzirl procedure. The culture medium remains sterile and chemically stable for many months, and the containers are easier to transport. As few as 10 spores per ml can be detected. (14pp)

KORT/ ★ D13 73770 D/41 ★CA 1108-10
Feed mill for producing animal feed from grain - has separate rotating chopper and crushing rolls

KORTE G J 29.08.77-CA-285630

C03 P41 (01.09.81) B02c-09/04

29.08.77 as 285630 (295NS)

Mill both chops and crushes grain. It consists of a hopper in which is positioned an elongate rotatable cutter located adjacent to the hopper outlet. The cutter has paddles for chopping and feeding the grain through the outlet. Beneath the hopper outlet is a pair of defined crushing rolls. The rolls have cylindrical surfaces formed with indentations arranged in a regular diamond pattern of intersecting rows extending helically about the rolls. The indentations are of inverted pyramid shape and are surrounded by protuberant edges. Crushed grain is removed by a conveyor from beneath the crushing rolls.

The mill chops and crushes various types of grain or vegetable to produce an animal feed. The grain kernels are cracked or broken in several places but are only partially crushed. This facilitates digestion by the animals so that they obtain maximum nutrient value. (6pp)

Sugar free chewing gum of high water content - comprising gum-base, solid and liq. sorbitol and aroma agent

BARNANGEN DEUTSCHLA 21.03.80-DE-010836

(01.10.81) A23g-03/30

21.03.80 as 010836 (1251BJ)

Chewing gum comprises (wt.%) chewing gum base 18-35 (25-31)%, total water 8-4 (10-13)%; aromatising agents 0.7-2 (0.8-1.2)% and sorbitol 49-73%, esp. 27-33% solid sorbitol and 37-43% liq. sorbitol. The compsn. is made by warming the base material to 40-45 deg.C and kneading while adding solid sorbitol. When this has mixed in sufficiently, sorbitol dissolved in water is added, followed by the aromatising agent and opt. lecithin, and the whole mass kneaded.

A sugar-free gum, esp. useful as a soft bubble gum, is prod. which does not require fatty acid derivs. etc. to be added as softener (the high water content provides adequate softening). A satisfactory degree of sweetness is achieved with a relatively small amt. of sorbitol, without need for any saccharin. (10pp)

CTAF- ★ D13 73948 D/41 ★DE 3011-435
Compsn. contg. maleuric acid for treating orotic acid deficiency - and as orotic acid replacement, e.g. for improving growth and fertility in humans, animals and plants

CTA-FINANZ AG 25.03.80-DE-011435

B05 C03 (01.10.81) A01n-47/34 A23k-01/16 A23l-01/30 A61k-31/19 C09k-03

25.03.80 as 011435 (1251BZ)

The use of maleuric acid (I) or its pharmaceutically acceptable salts or esters in fodder additives, dietetic foods, or veterinary or pharmaceutical compsns. for treating orotic acid deficiency and/or as a replacement for orotic acid to encourage the growth or enhance the fertility of animals and plants (higher plants or useful microorganisms) is new. Compsns. contg. (I) or its derivs. are also claimed. Pref. the unit doses contain 0.1-1000 mg (I) and the daily dose in humans or animals is 0.1-100 mg per kg per day.

Pref. unit doses contain 10-300 mg (I) and are formulated for oral (pref.), rectal or parenteral administration. The max. daily dose is esp. 30mg per kg.

Compared with orotic acid, (I) is easier and cheaper to prepare, and its toxicity, relative to the effective dose, is very low. Activities exemplified include stimulating growth of plants and yeasts; liver-protecting effect; inhibiting enzymes such as amino acid deaminase, insulinase (insulin-stabilising effect) or amino acid decarboxylase (prevention of enterotoxaemia); and regulating intestinal microflora (encouraging Lactobacilli at expense of coliforms). 13.03.81 as 101863 (280HM) (G) No-Citns. E(AT BE CH DE FR GB IT LI NL SE)

1-O-Acyl-glycerol-3-phosphoric acid haloalkyl esters (I) are new. In (I) R is an acyl residue -CO-R₁ in which R₁ is opt. unsaturated 1-25C alkyl; R₃ is halogen; y is 2-12; and X⁺ is one equivalent of a mono- or divalent cation. Also new is a process for the prodn. of glycerol-3-phosphoric acid derivs. of formula (III). In (III) R₃' is halogen or a group -N(+)X₁X₂X₃ in which X₁, X₂ and X₃ are H or 1-6C alkyl; n is 0 or 1; and R is H or an acyl residue -CO-R₂ in which R₂ is opt. unsaturated 1-25C alkyl, R being other than H when R₃ is halogen. In prodn. of (III) (I) is acylated with an acid anhydride (R₂CO)₂O and/or reacted with a cpd. NX₁X₂X₃.

(I) is prepd. from cpds. of formula (II). In (II) R' is an acyl residue -CO-R₂ or benzyl by hydrolytic removal of an acyl residue R' in the presence of phospholipase A₂ or by catalytic hydrogenolysis of a benzyl residue R'.

(I) and cpds. (III) in which R₃' is halogen are intermediates for glycerine phosphatides (III) in which R₃' is NX₁X₂X₃, which in turn are useful as agents for influencing cell membranes in warm-blooded animals, as physiologically innocuous surface-active agents (e.g. for use in foods or cosmetics), and as antioxidants in the leather and textile industry. P13 (07.10.81) A01j-25/16
26.03.81 as 009605 (1358AS)

Curd is pressed in a mould, then brined by flowing brine over the cheese, and finally pre-dried and cured. After pressing the cheese may be circulated and placed in mobile racks with tiers of liq. permeable structures for brining by passing the racks under a fixed watering system.

The cheeses are pref. left in the racks for pre-drying and curing. Cheeses are pref. treated with a fungicide penetrating the rind simultaneously with brining. The racks pref. have freely suspended nets of flexible threads. The method provides rapid efficient brining. (6pp)

MEIJ ★ D13 74345 D/41 ★ GB 2072-679
Low-carbogenic sweetener compsn. comprising oligosaccharide(s) of one to four molecules of fructose bound to sucrose
MEIJI SEIKA KAISHA 12.12.80-JP-174667 (31.03.80-JP-040193)
B03 E13 (D16) (07.10.81) A23l-01/23 C12p-19
3.03.81 as 008915 (476BZ)

A new product consisting of oligosaccharides having 1-4 molecules of fructose bound to sucrose is prep'd. by reacting sucrose in the presence of fructosyl transferase. The product of this process, which contains, in addition to the oligosaccharides, unreacted sucrose and glucose and fructose may be selectively catalytically reduced to convert the two last-named sugars to sorbitol and mannitol.

The new product is low-carbogenic sweetener. The oligosaccharides it contains may be isolated and purified but the mixture is pref. used as it is. The oligosaccharides do not react with dextran sucrose to produce insoluble dextran, which is the main cause of dental caries, and they also suppress the formation of insoluble dextran from the sucrose. The product has a sweetness of 60-80 (sucrose is 100), has about the same viscosity, freezing point depression and osmotic pressure as sucrose, has excellent moisture retention properties and is non-crystalline. The reduced product contg. sorbitol and mannitol is also a low-carbogenic sweetener compsn., and the amount of lactose produced from this compsn. by the action of microorganisms is only about 20% of that produced by sucrose, and is also less than that produced by the non-reduced product. (11pp)

Conjugated protein prodn. - by mixing partially decomposed casein alkali metal salt with protease and heat-coagulating protein

WAKODO KK 30.01.80-JP-009700
A11 (24.08.81) A23j-03 A23l-01/32
30.01.80 as 009700 (5HM)

The conjugated protein is prep'd. by mixing (a) a casein alkali metal salt which is decomposed to a degree of 15-35% (expressed as soluble nitrogen ratio) with protease (e.g. trypsin, papain, etc.) and (b) heat-coagulating the protein. The casein alkali metal salt (a) does not have gel-forming properties by itself, but the conjugated protein prep'd. as above has stronger gel-forming properties than all of its constituents. By changing the proportion of (a):(b) a conjugated protein of optional gel-forming properties is obtd. The casein alkali salt (a) has low sensitivity to heat and by combining it in suitable amt. the heat-sensitivity of the obtd. conjugated protein is controlled. It has wide use as a food material. The reason why the conjugated protein has higher gel-forming properties than its constituent proteins is not clear but it is assumed that the partly decomposed casein alkali salt and heat-coagulating protein react to form crosslinkages between molecules and the crosslinkage exhibits strong gel-forming properties. (3pp)

KODA- ★ D13 74472 D/41 ★ J5 6106-563
Granulating guar gum using kneading agent - of methyl-cellulose in solvent mixt. of ethanol and water
KODAMA KK 25.01.80-JP-007633
A97 (24.08.81) A23l-01
25.01.80 as 007633 (5BZ)

Method comprises kneading powdery guar gum with the kneading agent prep'd. by combining methyl-cellulose in solvent mixt. composed of ethanol and water in the wt. proportion of 2:3:3:2, granulating the mixt., drying the granules and regulating their size.

Guar gum is composed of galactomannan which swells 50-100 fold in vol. with cold water. Tried as dietetic food it was found difficult to take in powder form because it swelled enormously in mouth. Also it has been reported that guar gum shows curing effect on diabetes. To granulate guar gum proper kneading agent is required. The above kneading agent can impregnate guar gum powder without swelling it.

Methylcellulose is combined in an amt. of 1-5 (esp. 3) w/w% in the kneading agent and the kneading agent is used with the wt. proportion of guar gum: kneading agent of 4:3:3:4, pref. (4:3). The drying is carried out to moisture content of ca. 4 w/w%. The obtd. granular guar gum shows the swelling time of 90-110 seconds. Thus one can easily take it and can feel the fullness of stomach. (3pp)

MIYA- ★ D13 74473 D/41 ★ J5 6106-578
Vegetable polyhydric phenol-contg. cold drinks and gelatinous foods - clarified by combining with condensed phosphate
MIYAGIKAGAKU KOGYO 31.01.80-JP-009419
(24.08.81) A23f-03/16 A23f-05/24 A23l-01/04 A23l-02
31.01.80 as 009419 (5HM)

Method comprises combining at least 0.02 w/w% of condensed phosphate in cold drinks contg. vegetable polyhydric phenol partic. tannin or gelatinous foods prep'd. by mixing the drink with thermo-reversible gellable protein. When food contg. large amts. of tannin such as black or green tea, coffee, etc. is extracted with hot water, a hot clear extract is obtd. When the hot extract is cooled, the extract clouds. If the hot water contains polyvalent ions such as alkaline earth metal, Fe etc. brown or red brown ppt. is formed in the extract. Gelatinous foods prep'd. by mixing the extract with thermo-reversible gellable protein such as gelatin and combining the mixt. are usually cloudy. Condensed phosphate clarifies the cold drinks or gelatinous foods or prevents their clouding.

The clouding by the reaction between tannin and gelatin is specific to gelatin and is used as the confirming test for gelatin by the Japanese Pharmacopoeia. (6pp)

TOAG ★ D13 74474 D/41 ★ J5 6106-580
Stabilising agent for fruit and vegetables - comprises iron type oxygen adsorbent, hygroscopic or deliquescent salt, and soluble acidic material for maintaining freshness

TOA GOSSEI CHEM IND LTD 29.01.80-JP-008365
(24.08.81) A231-03/34

29.01.80 as 008365 (5RP)

Freshness-maintaining agent consists of (a) iron-type oxygen absorbent; (b) hygroscopic or deliquescent alkaline earth metal salt; (c) bicarbonate; and (d) the solid substance, of which aq. soln. is acidic.

The component (a) is (1) iron powder and its partial oxidised prod., (2) ferrous cpd., (3) complex oxide of Fe such as triiron tetraoxide and (5) the compsn. obtd. by combining metal halide and/or water and/or water insoluble bulking agent in Fe powder (1) or Fe cpd. (2), (3) or (4).

When the mixt. in tablet form or powder form is packaged with gas-permeable water-repelling material and packaged with food, the component (a) absorbs oxygen in the package and the component (b), (c) and (d) react with water forming CO₂ gas. Thus not only oxidn. and the discolouration of the food can be prevented, but also the multiplication of both of aerobic microbes and anaerobic microbes can be suppressed. Further CO₂ gas shows the freshness-maintaining effect on vegetables and fruits. (9pp)

QPPP ★ D13 74919 D/41 ★ J5 6109-545
Sterilised conc. liq. egg white prodn. - by adding sugar, condensed phosphate and powdered bile to egg white and heat-sterilising

Q.P. CORP 05.02.80-JP-012856
(31.08.81) A23b-05

05.02.80 as 012856 (5WB)

Egg white is pre-concd. to 1.5-3 times solids concn. of original egg white. The sugar, condensed phosphate and powder bile are used in amts. 0.5-2 pts., 0.001-0.005 pts. and 0.0005-0.005 pt. respectively per 3 pt. liq. concd. egg white. Heat-sterilisation is at 60-70 deg.C for 5-30 mins. The egg white can thus be heat-sterilised at high temp. without deteriorating its foaming property. The obtd. egg white can be used in confectionery. (5pp)

MOMI ★ D13 74920 D/41 ★ J5 6109-548
Bran-pickling compsn. prepn. - by mixing rice bran and protein treating mixt., with protease, inoculating with lactic acid bacteria, fermenting and concentrating

MORINAGA & CO LTD 04.02.80-JP-012197
(31.08.81) A23b-07/10 A231-01/21

04.02.80 as 012197 (5AT)

The compsn. for bran-pickling use can be prepd. by (a) mixing rice bran and protein food (e.g. soy bean protein, soy bean lees, casein, gelatin, skimm milk, etc.), (b) treating the mixt. with protease, (c) inoculating with lactic acid bacteria yeast and gram-negative bacteria in the protein-decomposed bran, (d) fermenting it at pH 4.4-5.8 for more than two days pref. for 2-6 days, (e) concentrating or drying thus obtd. fermented bran by heating, reducing pressure, freezing, etc. and adding salt, organic acid, flavouring, etc. so the aq. suspension of objective compsn. has salt concn. 4-8% and organic acid concn. 0.2-1.4%. If necessary concn. or dried fermented bran and the additives are packaged separately in two packages and are suspended in water on use. Bran-pickled vegetables can be prepd. either by suspending compsn. in water and immersing vegetables in the aq. suspension for 4-48 hrs. or by mixing compsn. in the bran bed for bran-pickling use prepd. as usual and pickling vegetables in the mixt.

The desired flavour of bran bed can be formed in a short time. The salt concn. and organic acid concn. in aq. pickling suspension are decided on the consideration of the osmotic pressure relations between the aq. pickling suspension and vegetables. When the aq. suspension is used repeatedly, it is necessary to add the pickling aids to keep the pickling suspension salt concn. at 4-8% and organic acid concn. at 0.2-1.4%. (11pp)

WAKD ★ D13 74921 D/41 ★ J5 6109-549
Bean curd milk protein mfr. - by adding oil and fat to soln. of alkali caseinate and milk serum protein, emulsifying, heat treating and coagulating

WAKODO KK 01.02.80-JP-011114
(31.08.81) A23c-09

01.02.80 as 011114 (5WB)

The bean curd is prepd. by (a) adding oil and fat to aq. protein soln. consisting of alkali caseinate and soluble milk serum protein, (b) emulsifying the mixt., (c) heat-treating it and (d) coagulating it with coagulant.

Pref. starting aq. protein soln. is prepd. that it contains 5-15 w/w% protein composed of alkali caseinate and soluble milk

to below 50 deg.C and fluid oil and fat (e.g. butter oil, sesan etc.) is added in amt. 5-15 w/w%. The mixt. is emulsified u homogeniser and the emulsion is heat-treated, e.g. at 98-100 for a min., at 90 deg.C for 5-10 mins., at 80 deg.C for 15-30 min at 70 deg.C for 30-60 mins. The emulsion is at once cooled to deg.C and coagulant (e.g. sec. calcium phosphate, tert. ca phosphate, calcium carbonate and glucono-delta-lactone, e added. The mixt. is heated to 90-98 deg.C and after charging mould, allowed to cool.

Bean curd obtd. has fine texture and shows good shape-ho property. Its cross-section is white and glossy. It is not defo nor denatured in hot water or by freezing it. It is not nutritive, but also has excellent taste and flavour. (3pp)

KIMI- ★ D13 74922 D/41 ★ J5 610
Animal feedstuff prepn. - by adding alkali arginate to components and then adding organic acid of stronger acidity acetic acid

KIMITSUKAGAKU KENK 31.01.80-JP-011614
C03 (31.08.81) A23k-01/20

31.01.80 as 011614 (5WB)

Method comprises adding alkali arginate to feed com consisting of at least one of vegetable protein, fish pow activated sludge, minced fish, etc. and then adding organic which is stronger than acetic acid to the mixt. The organic hydrolyses alkali arginate to free acid and forms a good j Alkali arginate can be made into the free acid at pH about 4. organic acid is citric acid, tartaric acid or malic acid. C breeding results are obtd. with the feedstuff. (3pp)

Bean milk prodn. from soya with good protein extn. - by
extracting beans with organic solvent and extracting bean milk
from residue using water
MITSUBISHI GAS CHEM IND (MITU) 17.03.76-JP-028969
(11.09.81) *J52114-050 A23l-01/20 + A23j-03
03.76 as 028969 (5DJ)
Method comprises extracting (defatted) soy bean (I) with organic
solvent, extracting bean milk from the residue with deoxidised
water (DO less than 0.15 ppm) at 5-70 deg.C or hot water at 70-100
deg.C of which the amt. is the same or more than the wt. of (I),
and removing organic solvent remaining simultaneously or after
extracting bean milk.
Low odour bean milk can be prepd. from soy bean with a high
extraction rate for protein. Defatted soy bean is extracted as it is
without removing the solvent, and the solvent is removed during
after the extn. The extraction of bean milk is pref. effected
under anaerobic conditions. By adding a chelating agent for
metal ions and/or alkali to the water the extraction rate for
protein can be further increased. Typically, the soy bean is
washed in water, and bean milk and soy bean waste are sepd. by
centrifuge etc. (J52114050) (5pp)

IKK D13 41477 A/23 = J8 1039-173
Non-astringent soy bean milk prepn. - by causing water to be
absorbed in the peripheral part only of soy beans, heat treating
etc.

KIKKOMAN SHOYU KK 14.10.76-JP-122224
(11.09.81) *J53047-566 A23c-11/10 A23l-01/20
10.76 as 122224 (5AS)
Method comprises immersing whole soy bean or de-filmed soy
bean in water to absorb water in the peripheral part only of each
bean, heat treating at 70-150 deg.C for specified time immersing
water again to dissolve out the astringent component, taking it
out and mashing it as usual.
Bean milk which is free of astringency and excellent in
solubility of proteins and has low sugar content can be obtd. Thus
obtd. bean milk can be applied favourably as material for bean
milk, ice cream, flavoured drinks etc. (J53047566) (5pp)

ITU D13 52506 A/29 = J8 1039-174
Soybean milk prodn. - by mashing bean in hot water, heating to
inactivate oxidising enzyme and homogenising
MITSUBISHI CHEM IND KK 25.11.76-JP-141529
(11.09.81) *J53066-466 A23c-11/10 A23l-01/20
11.76 as 141529 (5DH)
Soybean which has not been immersed in water is mashed in hot
water at 70 deg.C to b.pt. and the mashed prod. heated between
b.pt. and 190 deg.C. The obtd. mashed prod. is homogenised
under a pressure of 150-2000 kg/sq.cm.
Bean milk having smooth texture and free from grassy smell
during preservation, is prepd. in high yield. The method does not
include the immersing process for soy bean and the method is
free of the pollution problem caused from waste water. No bean
curd waste is produced.
Pref. mashing is carried out with 6-25 times wt. soy-bean of hot
water to extract proteins. Pref. in the hot water, 0.03-1 w/w% on
soybean of the chelating agent for metallic ions (e.g.
polyphosphoric acid, citric acid etc.) or its alkali metal salt
and/or 0.01-0.075 geq. on soybean 1 kg. of alkali hydroxide is
added to improve NSI. Further 0.01-3 geq. on soybean 1 kg. of
deodorising salt (e.g. NaCl, Na malonate, etc.) may be added to
improve NSI. By the heat-treatment undesirable physiologically
active substance such as the oxidising enzyme for unsatd. fatty
acids and trypsin inhibitor etc., can be inactivated. (J53066466)
(5pp)

MITU D13 52508 A/29 = J8 1039-175
Soybean milk prodn. - by mashing bean in hot water, sepg. bean
curd waste and heating under specific conditions to inactivate
oxidising enzyme
MITSUBISHI CHEM IND KK 27.11.76-JP-142423
(11.09.81) *J53066-468 A23c-11/10 A23l-01/20
27.11.76 as 142423 (5RH)
Soybean which is not immersed in water, is mashed in hot water
at 70 deg.C to b.pt. The bean curd refuse is sepd. from the mashed
prod. and the obtd. bean milk heat-treated under specific
conditions for inactivating oxidising enzyme sufficiently.

In mashing, a chelating agent for metal ions (e.g.
polyphosphoric acid, citric acid etc.) or its salt is added in an amt.
of 0.03-1w/w% on soybean and/or alkali hydroxide 0.01-0.075 geq.
on 1kg. of soybean for increasing the yield of bean milk. Pref. a
salt showing deodorising effect e.g. NaCl is added. After
mashing, the sepn. is practised without cooling the mashed prod.
The bean curd refuse is washed sufficiently with de-oxygenised
water to recover bean milk. The obtd. bean milk is then heat-
treated under the specific condition. Finally the bean milk is
cooled by flash-cooling, and the deodorising and the concn. occur
simultaneously. It is pref. to practice the whole process at more
than 50 deg.C or to practice the whole process under anaerobic
condition for improving the quality of bean milk further.

The extn. of protein is increased, and bean milk does not get
grassy smell during the preservation. Process does not include
the immersing process for soy bean and the pollution problem
caused from the waste water can be avoided. (J53066468) (4pp)

Automatically controlling caramel degree of liquid - by measuring light reflected from liquid surface by two different wavelength radiations (NL 23.1.78)

MORINAGA & CO LTD 19.07.76-JP-085790
+ P28 (16.09.81) *DE2732-609 A23g-03/02
08.07.77 as 007647 (160HM)

The method caramellises liq. for sweets, boiled liq. from a boiler being delivered into a vessel where it is stirred and caramellised before passing to a cooling vessel.

A detector is provided for the degree of caramellisation near the surface of the liq. in the cooling vessel, light being reflected from the surface and divided into its continuous spectrum, from which two bands spaced apart are selected. The bands are converted into electrical signals, from which a caramellisation value is derived. Its value is compared with set upper and lower ones and a control signal is generated, automatically regulating the speed of the stirring mechanism. (8pp)

The machine produces frozen foods comprising a cone or cup from whose open end a filling protrudes, this being cooled to below freezing point, and a covering over the protruding portion. It comprises a filling station, a freezing tunnel with an endless conveyor, and a covering station for the filled cones etc.

The conveyor transports the cones upright through the tunnel and protrudes at one end. It conveys the cones through the top part of the tunnel and back again through the bottom, the top part delivering the filled cones into the tunnel and the bottom one the frozen ones out again. The filling station is outside the tunnel and above the belt, delivering the liquid material, while below the belt is a vessel filled with liquid covering material and which can travel with it. This is followed by a further vessel with a spring bottom containing edible particles for adherence to the covering (10pp)

Novel synthetic phosphatidyl quat. ammonium cpds. are of formula (I). In (I) R is 14-20C hydrocarbyl; a, b and c are integers of 0-3, and a, b and c in total are equal to at least one; d is integer of 1-5, except that in combination a, b and c cannot be zero and d cannot be 2; and R1-4 are each methylene radical.

Pref. R is an ethylenically unsatd. hydrocarbyl. Specific (I) is dioleoyl phosphatidyl -(methylethylene-N-triethyl) ammonium. The cpds. have a hydrophobic/hydrophilic balance different from natural phosphatidyl choline. This is brought about by changes in the quat. ammonium polar gp. to provide difficult surfactant properties.

The cpds. are useful substitutes for lecithin for solubilising non-aq. soluble cpds. They may be useful in the regression of atherosclerotic lesions and as antiatherosclerotic agents in blood etc., and as stabilisers and emulsifiers for food prods. (5pp)

 Ambient stable, starch-contg. soup, gravy, etc. concentrate - mtg. osmotic pressure increasing agent and water activity depressing agent
LIPTON T J INC (UNIL) 07.12.78-GB-047554
(22.09.81) *EP--12-465 A23l-01/40
 12.79 as 100884 (974TM)

Ambient stable concentrates form at 65-100C, on dilution with water or aq. liq., into a lump-free thick soup, sauce gravy or dessert. They are produced by (i) producing a concentrate contg. water, starch, an osmotic-pressure increasing agent (I) and a water-activity depressing agent (II); (ii) filling into containers; (iii) sealing the containers and (iv) pasteurising at 60-100C.
 (I) is sufficient to reduce the rate of swelling of the starch and to prevent gelatinisation during (iv). (II) reduces the water activity to not more than 0.92. Concentrates are e.g. mushroom soup, tomato soup, bearnaise sauce or custard sauce concentrates. (4pp)

RETR- ★ D13 75727 D/41 ★ WP 8102-792
 Detecting lactam type antibiotics in milk - by binding in competition with enzyme labelled antibiotic to purified immobilised antibody

RESTRIANGLE INST 20.03.80-US-131914
B05 C03 S03 (B04) (01.10.81) G01n-33/54
 20.03.81 as U00354 (1251HM) (E) US4190496 US3791932 2.Jnl.Ref N(AU DK FL JP NO) E(AT CH DE FR GB LU NL SE)
 Antibiotics (I) are detected in milk by first contacting the sample with a solid matrix supporting purified immobilised antibody (A6) specific for (I) and with an enzyme-labelled antibiotic (I'). The matrix is then removed, rinsed with water, then contacted with a substrate (S) which gives a colour change in presence of (I'). This change is a measure of the amt. of (I') bonded and is compared with the colour change in a standard to determine the concn. of (I) in the sample.

The matrix is pref. the inside of a polystyrene or glass tube, beads in a column or a rod, and (S) is esp. a mixt. of m-phenylenediamine and hydrogen peroxide. Also new is a method for preparing purified (A6).

The method is used to detect lactam-type (I), esp. benzyl penicillin. It is relatively inexpensive, measures concns. down to 0.01 units per ml, does not require skilled personnel and by using a pure (A6) a more equal competition between free and conjugated (I) is obtd., so assay times are reduced (to about 10 min). (32pp)

21.01.80 as 004531 (117HM)
 Extruded tube package for retort sterilisation consists of flexible seamless cylindrical torso, composed of an intermediate layer made of an oxygen-barrier thermoplastic resin, e.g., an ethylene-vinyl alcohol copolymer contg. 40-85 mol.% vinyl alcohol units, having an oxygen permeation coeff. of 5.5 x 10 power minus 12 cc.cm/sq. cm.sec.cmHg (at 37 deg. C and 0% RH), and outer and inner layers made of a heat-resistant olefinic polymer, e.g., high density polyethylene, crystalline polypropylene or propylene-ethylene copolymers, each layer being bonded to the other layer with the aid of an adhesive, e.g., a carbonyl gp. contg. thermoplastic resin, together with a bottom hot-bonded with the cut end portion of the torso. The mfg. method for extruded tube package consists of a process in which the (extruded) torso is cut, the contents are filled in the cut torso, the cut end portions of the torso filled with the contents are hot-bonded with each other, and the extruded tube package obtd. is subjected to retort sterilisation treatment.

This method for extruded tube package effectively and simply

performs extrusion, packing and retort sterilising processes on continuous basis, and is suitable for the mfr., packaging and storage of various foods, etc. (8pp)

Catalytic reaction tank for liq. - contains inclined baffles for efficient sepn. of catalyst from treated liq. without use of external energy

ATEL CONSTR ELEC CHARLER 19.03.81-BE-888016

J04 (21.09.81) B01j

19.03.81 as 888016 (1144DH)

The tank forms a prim. decantation chamber with a rectangular cross-section; and a bed of a physicochemical- or biological- catalyst is located in the base of the chamber, which also has a bottom inlet for a reactive liq. In the chamber is a flat baffle inclined at 50-65 deg. w.r.t. the horizontal, and forming a gas collection hood.

The baffle leaves a space near one chamber wall, so a sec. decantation chamber is formed in the tank above the baffle. The sec. decantation chamber contains a stack of inclined sheets spaced apart and parallel with the baffle, and also a top outlet for the liq. treated by the catalyst.

Used in the treatment of contaminated waste water. The inclined baffle and sheets provide complete recovery of the catalyst, i.e. the latter does not reach the top outlet for the treated liq. (7pp)

cement mixer flushing water neutralisation - by adding carbon dioxide under pH value control

BOTTROPER STAHLBAU 25.03.80-DE-011379

L02 (01.10.81) C02f-01/66

03.80 as 011379 (39HM)

Waste water from the flushing of concrete mixers and other concrete machinery has an extremely high pH-value and must be allowed to drain off without treatment. It is passed through a scrubber in which gaseous carbon dioxide is mixed with the turbulent liquid. A pH-meter supervises the alkalinity and keeps the liquid in a closed circuit until the desired pH-value is reached. The flushing water is admitted through pipe to the scrubber where tubular insets keep it in turbulence. Carbon dioxide is admitted through an adjustable control valve from the bottle. A pH-meter causes a control unit to keep an outlet valve near the meter shut so that the liquid circulates in a closed loop until the pH-value is reduced.

This is a quick process which saves the expense and space for settling basins. (17pp)

Floculating tank for clarifying water - in which water dosed with
floculating agent is supplied to evenly spaced locations at tank
bottom

NEWCASTLE GATESHEAD 10.01.78-GB-000828
(07.10.81) C02f-01/52
01.78 as 000828 (67BZ)

Floculating tank for clarifying impure water using a
floculating agent comprises a settling tank in which the
floculating agent is added to water entering the tank. The water
supplied to the bottom of the tank at a no. of evenly spaced
locations from branched supply heads each comprising a central
pipe and a symmetrical arrangement of curved branch pipes
extending downwardly into the tank. The floculating agent
forms a porous scum through which the water flows upwardly
and clarified water is drawn off above the scum level.

Used for purificn. of impure water for domestic and industrial
use. (4pp)

Dosed recycle appts. for drinking water prodn. from waste
water, comprises a microprocessor responsive to the output of a
system which monitors a filtration unit, a demineraliser, and a
biological aerobic treatment unit.

The microprocessor controls back-flushing of the filtration
unit, water quality, and fail-safe controls, as well as operation of
the demineraliser and aerobic unit, according to detection of
variations in their operation by the monitoring system. (8pp)

YST- ★ D15 74288 D/41 ★GB 1599-760
Aerobic microbial conversion or organic matter to methane
and liq. - using fermentation column with height to width ratio of
to 20:1

UNIV OF STRATHCLYDE 26.03.77-GB-012827
C04 E17 (C03) (07.10.81) C02f-03/28
05.81 as 012827 (916BZ)

Aerobic microbial conversion of organic matter to methane
and a liquid product is achieved by passing a suspension or soln.
of the organic matter containing micro-organisms, including
methane producing types, into a column with a height to width
ratio of 7:1 to 20:1 and maintaining at 5 to 50 deg.C. As the organic
matter is converted, fresh material is added to the column and
spent material removed.

The organic matter may be pig slurry, cow slurry, yeast slurry,
ground cereal slurry, alcoholic washes, yeast extracts, fish by-
products, slaughterhouse effluent, seaweed residues, cellulose
and organic materials protected from deterioration by content of
organic acid. The microorganisms for the culture may be
obtained from animal manure, grass clippings, mud from
stagnant water, animal digestive tracts, industrial effluent and
municipal anaerobic digestors.

The solid material produced can be used as a soil conditioner
and fertiliser. Methane is produced in high yields. The energy
consumption is low. (4pp)

CRAW/ ★ D15 74290 D/41 ★GB 1599-809
Water distn. plant - which ducts atmos. enclosed in flexible sheet
envelope to condenser

CRAWFORD FA 20.04.78-GB-015579
(07.10.81) B01d-03
04.78 as 015579 (67MR)

The plant comprises a flexible sheet or envelope, pref. of plastics,
isolating an atmos. exposed to the free surface of water to be
heated from the surrounding atmos. The atmos. within the sheet
envelope is ducted to a condenser. The water beneath the sheet
envelope is heated to cause evapn. from the free surface, e.g.

by the sun's rays passing through the sheet or envelope or by
discharging hot industrial waste into the water.

This simple construction is capable of distilling contaminated
water irrespective of its solid content. (5pp)

07.02.78 as 004917 (006TM)

Sludge dewatering method esp. for sewage, involves depositing
sludge on a sand bed which contains porous drainage pipes and is
within dikes. Drainage water is pumped from the pipes i.e. to
outside the dikes.

In the sludge surface one or more trenches are formed
connecting with a drainage conduit for collecting surface water
from the trenches and leading it outside the dikes. Pref. cable-
operated carriages have tools for trench-forming by compression
e.g. rollers. (-pp)

MCOB- ★ D15 74333 D/41 ★GB 2072-649
Fermentation plant produce gas from manure - with elastic
insulating roof supported on network of ropes

MCO BYGNADS AB 28.03.80-SE-002406
(D16) (07.10.81) C02f-03/28
24.03.81 as 009101 (295BJ)

Gas is produced from organic matter such as manure using a
fermentation plant. This includes a tank with an elastic roof.
Organic matter is delivered to the tank and fermented residues
are withdrawn. The gas is removed via a conduit. The roof
consists of an open-work carrying structure of strands or ropes
stretched over the top of the tank, and freely supporting an
insulating layer. Both the structure and insulating layer are
secured to the outside wall of the tank.

The apparatus is used to produce gas used as a fuel for a
furnace or internal combustion engine. The roof structure is
cheap, safe in use and minimises gas leakage.09 (6pp)

TEIJ ★ D15 74670 D/41 ★J5 6108-504
Cellulose ester reverse osmosis membrane prodn. - by casting
soln. of the ester and swelling agent comprising organic cpd.
contg. carboxyl and carboxamide gps.

TEIJIN KK 04.02.80-JP-011426
A88 J01 (A11) (28.08.81) B01d-13
04.02.80 as 011426 (96RP)

The process comprises casting a soln. consisting of cellulose
ester, solvent and swelling agent. Organic cpd. of molecular wt.
of less than 350, which contains below 5 carboxyl gps. (-COOH)
and carboxamide gps. (-C(O)N(H)-) in total of both, if necessary,
less than 3 hydroxyl gps. is used as swelling agent.

Strict temp. control is not required. Film making may be
carried out at room temp. Good quality membrane may be obtd.
over wide range of condition.

Typically into a mixed solvent of 37.8g of acetone and 46.8g of
1,4-dioxane there was dissolved 17.7g of a mixt. of cellulose di-
acetate and cellulose triacetate, and to the soln. there was added
soln. dissolved 3g of HOOCCH:CH-CONHCH2CH2OH in 7 pts. of
methanol, and the resulting soln. was cast in 0.2 mm thickness on
a glass plate. After evaporated the solvent at 25 deg.C and 35%
humidity, the cast was immersed in ice water to gelatinise. After
1 h, the membrane was drawn, and treated in hot water
maintained at a given temp. for 5 min. (7pp)

TEIJ ★ D15 74671 D/41 ★J5 6108-505
Reverse osmosis membrane comprising cellulose ester mfr. - by
casting a soln. contg. cellulose ester, solvent and swelling agent,
partially drying and immersing it in non-solvent mfg.

TEIJIN KK 04.02.80-JP-011427
A88 J01 (A11) (28.08.81) B01d-13
04.02.80 as 011427 (96AT)

Mfg. reverse osmosis membrane consisting of cellulose ester
comprises casting a soln. contg. cellulose ester, solvent, and
swelling agent, and after partially drying it, immersing the cast
in non-solvent. Trimellitic acid alone and/or additional cpd. of
trimellitic acid anhydride and monoalcohol of less than 4C or
glycol are used as swelling agent.

In an example, to 102.31 g of soln. consisting of 14.17g cellulose
diacetate, 3.54 g cellulose triacetate, 37.8 g acetone and 46.8 g 1,4-
dioxane was added a soln. contg. 3 g trimellitic acid dissolved in
mixed soln. of 7 g of methanol and 3 g of water to prepare casting
soln. The casting soln. was cast in thickness in 0.2 mm on a glass
plate, and solvent was evapd. at room temp. and 35% humidity.
Afterward, the cast was immersed in ice water to gelatinise.
After 1 hr, the membrane was drawn, and treated in hot water.

The swelling agent makes it possible to mfr. a good cellulose
ester membrane by room temp. filming, and the membrane may

be widely used in the form of tubular, spiral or hollow fibre modules. (4pp)

MITO ★ D15 74694 D/41 ★ J5 6108-587
Treating waste water contg. free chlorine etc. - by passage through activated charcoal impregnated with cobalt oxide

 Removing heavy metals from etching waste - by conversion to
 hydroxide(s) followed by flotation with addn. of black sulphate lye
 and polyoxyethylene
CELLULOSE PAPER IND RES 14.02.77-SU-451793
J01 M12 (23.01.81) C02f-01/24
 14.02.77 as 451793 (815VE)

Acid waste from etching processes is treated to remove heavy
 metals by neutralisation with formn. of hydroxides, which are
 then subjected to flotation, and the degree of purificn. can be
 increased to 98-99% and process time reduced with consequent
 energy savings if the flotation reagent used is black sulphate lye
 and polyoxyethylene, added in that order, in the ratio metal
 hydroxide to sulphate of 1:0.15-1.9, and hydroxide to
 polyoxyethylene 1:0.04-0.14, giving a ratio of sulphate to
 polyoxyethylene of 2:1-4:1. The degree of purification obtd. with
 either reagent alone is zero, and that obtd. with the previous

reagent was 95-98%. (4pp)

Liquid effluent cleaner - has smoothing partitions and perforated cylinder in one of feed channels formed by paired partitions with deflectors etc.

SAVIN A N 10.01.79-SU-711852

(23.01.81) C02f-01/24

10.01.79 as 711852 Add to 429030 (132MI)

The cleaner according to the Parent Cert. No. 429030 comprises a casing (1) split up by paired partitions (2) and having water-air mixture supply tubes, a clean-water recirculator, a coagulant dispenser, and a scraper. To increase the utilisation of the chambers thus formed, two perforated partitions supplement deflectors on partitions (2), and a cylindrical vessel closed at the top in one of the chambers incorporates smoothing partitions and a perforated cylinder. (3pp Dwg.No.1)

RAKH/ ★ D15 75408 D/41 ★SU-798-050
Removing hypochlorite from industrial waste - by conversion to calcium chloride and carbonate using formaldehyde soln.

RAKHIMOV R R 15.07.76-SU-386472

E36 (23.01.81) C02f-01/58

15.07.76 as 386472 (815VE)

Active chlorine in the form of hypochlorite is removed rapidly and simply from industrial wastes by treating with an 8-36% soln. of formaldehyde, which is inexpensive compared to the previous reagent, formic acid or its salts.

The process takes only 10 min. compared to the previous time of about 30 min., and gives cleaned water with a low level of mineral cpds. such as carbonates, since the formaldehyde reacts with the hypochlorite to give 1 mol. of CaCl_2 and 1 of CaCO_3 , instead of 1 of CaCl_2 and 2 of CaCO_3 as before.

The method is used in mfr. of calcium hypochlorite, chlorine, lime etc. and in non-ferrous metal extn. via their chlorides. (2pp)

Surface foam suppression on detergent contaminated lagoon - using powered barge to withdraw subsurface water and convert it to horizontal spray

CARTER F A 30.07.79-US-061916

P35 (22.09.81) A62c-27 C02c-01/08

30.06.79 as 061916 (295JB)

Foam on the surface of a detergent-contaminated body of water, is suppressed by using a powered barge. A horizontal C-shaped pipe, with an internal dia. of 8-12 inches is mounted above the gunnels of the barge at a height of 5-7 feet above the waterline. The pipe is arranged so that it encircles the bow and extends part way along the sides of the barge.

The only outlets from the pipe are a series of horizontal straight pipes 8-10 inches long and projecting from the pipe. A pump carried by the barge removes subsurface water which it directs to the pipe under sufficient pressure so that it is forced from the outlets simultaneously and is propelled 30-45 feet.

The barge may be used on any polluted water basin where foaming is a problem, e.g. waste from the wood pulping industry. The appts. obviates the use of chemical defoamants. (6pp)

Waste water aerator with surface rotor - and submerged impeller drawing gas down conduit for entrainment and circulation

KWAK D 02.03.79-US-016890 (22.12.77-US-863068)

P64 (22.09.81) B28b-01/26 C02f-03/16

02.03.79 as 016890 (295KB)

A liq. is aerated using an appts. which includes a basin holding the liq. and a gas located in a space above the surface of the liq. A vertical shaft has a surface aeration device mounted on it being immersible in the liq. for circulating and aerating the liq. near its surface.

A flow guide tube is positioned beneath the surface aerator and extends from a point just above the basin floor to a level just below the surface aerator. The shaft extends down through the guide tube and has a pumping impeller mounted on it for creating downward flow of liq. in the guide tube. A gas conduit interconnects the gas space with a top inlet region of the guide tube. A restriction in the inlet region creates a low pressure to entrain the gas. The mixt. of gas and liq. then pass downwardly to the bottom of the basin.

Used for aerating waste water. The appts. efficiently introduces a gas into a liq. with good bottom mixing. (7pp)

BROW/ ★ D15 75541 D/41 ★ US 4290-887
Appts. for decanting surface liquid - has rotatable support pipe rigidly connected to floating weir header

BROWN A D 03.10.78-AU-006205

Q42 (22.09.81) E02b-15/04

02.10.79 as 081294 (295KB)

A liq. surface decanter comprises a rotatable support pipe positioned horizontally beneath the surface. Downcomer pipes extend between the support pipe and a header conduit which is oriented parallel with the support pipe. A buoyancy float is arranged to support the header.

Weir slots are longitudinally formed on the header conduit so that when the device is supported on the surface of the water, liq. flows through the slots, along the downcomer pipes and into the support pipe from where it may be removed. The weir slots have opposed leading and trailing edges arranged so that liq. first flows over the trailing edge and then over the leading edge as the header conduit is lowered relative to the support pipe by rotation about it.

Used for decanting a clear liq. from a settled effluent in an appts. where the liq. level may vary. (5pp)

BAUE/ ★ D15 75543 D/41 ★ US 4290-890
Sludge dewatering using buoyant vehicle - to break up surface crust thus exposing fresh sludge to drying atmosphere

BAUER W J 12.02.79-US-011122

(22.09.81) B01d-01 C02c-03

12.02.79 as 011122 (295NS)

Sludge is stored in a lagoon where the moisture content of the surface sludge is reduced by exposure to the atmosphere. Periodically at least the surface of the sludge is agitated to break and submerge the crust formed during drying. This exposes further wet sludge to the atmosphere. The agitation is performed by a buoyant vehicle which is propelled across the lagoon. The agitation and breaking of the crust is continued until a relative thick crust is formed over a body of wet sludge. Then the upper portion of the crust is removed while leaving the wet sludge.

The process may be used to dewater sewage sludge, also tailings from mineral ore treatment, sludge from scrubblings of flue gases, dredgings from navigation channels and other industrial sludges. Moisture is continuously removed by exposure of fresh sludge to the atmosphere. (12pp)

A thermally or chemically stratified water basin is treated by conducting top water into the subwater through flow passages. The top water mixes with, and horizontally displaces the subwater.

The top water usually contains more oxygen than the lower regions. This is mixed efficiently with the bottom water. Due to convection currents, this mixt. rises to begin with until it reaches a depth where the densities of the surrounding water and the mixt. are the same. The movement of the mixt. is then deflected to the horizontal. Thus oxygen is introduced into the whole depth of the water basin.

The procedure improves the ecological state of a thermally and/or chemically stratified water basin e.g. a lake with a low-oxygen depth zone. (15pp)

Combined filtering and measuring device - including funnel, filter and overflow gutter, used in perfume brewing and distilling industries

AMERICAN HOME PROD CORP 20.03.78-CA-299259
J01 (D14) (01.09.81) B01d-23/08

20.03.78 as 299259 (295NS)

Device comprises a funnel including a body with a top rim and a dependent spout. A gutter surrounds the funnel to catch liquid spilling over the rim. A filter is positioned in the funnel and has a top edge which is sealed to the top rim of the funnel. Pref. the filter, funnel and gutter are circular in cross-section, the filter being a downwardly extending cone with its apex axially aligned with but spaced from the spout.

The device has many applications e.g. in the perfume, food, brewing, fermenting and distilling industries. (7pp)

Processing of biomasses of diverse nature comprises treatment with carbonyl cpds., thiocarbonyl cpds. and/or carbonyl cpds. in equilibrium with lower non-condensed N-alkylols in an aq. medium opt. with catalysts and/or additives. This is followed by condensation with suitable reactants (opt. in the presence of catalysts and/or additives and/or chain regulators) to form aminoplast (opt. contg. N-alkylol groups) or phenoplasts, at 0-200 deg. (pref. at about 20 deg.) and opt. at reduced or elevated pressure. Opt. undesirable components present are removed.

Pref. carbonyl cpds. are HCHO, crotonaldehyde and isobutyraldehyde. Pref. aminoplast components are urea, methylolurea, dimethylolurea, and crude, modified and/or stabilised azulmic acids. Pref. catalysts are H₂SO₄ and H₃PO₄. Modified biomasses contg. cell components and/or other reactive

materials can be used. The prods. are used as reactive fillers and/or flame-proofing agents in plastics and also as catalysts and/or catalyst supports. (60pp)

MILE ★ D16 74066 D/41 ★EP --36-543
Test strip for semi-quantitative glucose determination in urine - treated with ethylcellulose soln. to inhibit window-framing
MILES LABORATORIES INC 20.03.80-US-132281
B04 J04 (30.09.81) C12q-01/54

09.03.81 as 101698 (1251AS) (E) US3814668 US3298789 FR2215140 US3001915 US3092465 E(DE GB)

A test device for semi-quantitative determination of glucose in urine is made by (a) impregnating a porous carrier with a soln. of glucose oxidase, peroxidative cpd. and water-soluble iodide, (b) drying, (c) saturating with a soln. of 1.75-4.55g ethyl cellulose (I) per 100 ml solvent, (d) drying to leave a residue of (I), then (e) cutting into test strips. Pref. (I) is dissolved in benzene, toluene or esp. a 20.80 ethanol-toluene mixt. at 2.35-3.35g per 100 ml.

Test strips which have been treated with a soln. of 1.75-4.55g (I) per 100 ml solvents are themselves claimed.

The semi-permeable layer of (I) deposited prevents 'window framing' (i.e. development of isolated wet spots at the margin of the strip) without slowing down the reaction. Using (I) solns. of the specified concn., it is no longer necessary to control the ethoxy gp. content or viscosity so that a wider range of (I) types can be used. (16pp)

CORP ★ D16 74130 D/41 ★EP --36-662
Glucose isomerase immobilised on porous phenolic resin - used to convert starch hydrolysate to fructose
CPC INTERNATIONAL INC 24.03.80-US-132728
A96 B04 (30.09.81) C12n-11/08 C12p-19/24

23.03.81 as 102183 (1251HM) (E) No-Citns.
Immobilised glucose isomerase (A) derived from *Streptomyces olivochromogenes* ATCC 21114, 21713, 21714 or 21715 (or mutants) on a porous phenolic resin (B) is new (B) has total surface area 40-200 sq.m per g, as pores over 30 angstrom, with at least 30% of the pores 30-250 angstroms, and water-swelling capacity below 10 vol.%. Binding efficiency is at least 90% at enzyme loading 500 units per ml, or at least 80% at 100 units per ml, and enzyme half-life during isomerisation is at least 10 days.

(B) is esp. an anion-exchange type resin, and 50% of pores in the 30-250 angstrom range have radius 50-150 angstrom, esp. at least 20% in the 70-80 angstrom range. Also new is isomerisation of glucose using these immobilised enzymes.

The enzymes are used for conversion of starch hydrolysate to fructose, in continuous column systems. They allow high operational flow rates, long column life and low enzyme consumption. (15pp)

ICIL ★ D16 74154 D/41 ★EP --36-699
Extracting poly beta-hydroxybutyric acid from bacterial cells - using dichloro-ethane at low temp., without intermediate drying
IMPERIAL CHEM INDS LTD 00.00.81-EP-200352 (21.02.79-GB-006076)

A11 G02 (30.09.81) C08g-63/72 C12p-07/62
00.00.81 as 200352 (1251AT) (E) EP--14490 EP--15669 1.Jnl.Ref E(BE CH DE FR GB IT LU NL)

Extraction of poly-beta-hydroxybutyric acid (I) from bacterial cells comprises treating with 1,2-dichloroethane (II) at below 40 deg.C, then sepg. the (I)-contg. solvent phase. Opt. the cells are disrupted before extraction, and the solvent is applied to an aq. suspension of cells, esp. adjusted to with 0.5 pH units of the isoelectric points.

Pref. (II) is 10-100 times by wt. of the cells, and (I) can be sepd. from the extract by pptn. into a liq. in which (I) is insoluble but with which (II) is miscible.

(I) is useful as a plastic material for moulding, and solns. of (I) can be used directly for solvent casting of e.g. coatings, films and fibres. (I) can now be extracted directly from aq. cell suspensions, and the use of low extraction temp. minimises simultaneous removal of lipid and pigment. (17pp)

PFIZ ★ D16 74174 D/41 ★EP --36-737
Extracting lactase from yeast cells - by treating with alcohol or ketone, then with aq. buffer, opt. followed by protease deactivation
PFIZER INC 24.03.80-US-133036
(30.09.81) C12n-09/38

16.03.81 as 301094 (1251AS) (E) No-Citns. E(AT BE CH DE FR GB IT LU NL SE)

Lactase (I) is released from yeast cells by first treating with 20-95 wt.%, on total cell wt., of a 1-4C alcohol or di(1-4C)alkyl ketone at 5-35 deg.C. The cells are then treated with an aq. soln. of pH 5.5-8 (6.4-7), at the same temp., and the cells then removed from the (I) contg. soln. Pref. cells are *Kluyveromyces*, *Candida* and *Torula* species, and both treatments are esp. at 20-30 deg.C.

The first stage is pref. with 60-90 wt.% ethanol, and the aq. soln. of (I) recovered is pref. heated with 30-90 (30-60) wt.% on the soln.

of glycerol at 35-60 (45-55) deg.C and pH 5.5-8 (6.4-7) until protease content is reduced.

(I) converts lactose to glucose and galactose and is made e.g. in cheese making to shorten ripening times, or administered to persons intolerant of lactose. It is now recovered relatively quickly with good yields and purity and without interference from co-extracted protease. (7pp)

GENE ★ D16 74186 D/41 ★EP --36-776
Prodn. of polypeptide(s) from recombinant bacteria - by using plasmid(ic) expression vehicle obtd. by ligation of DNA fragments
GENENTECH INC 24.03.80-US-133296

B04 (30.09.81) C12n-15
23.03.81 as 301227 (1248JB) (E) No-Citns. E(AT BE CH DE FR GB IT LU NL SE)

Creation of an expression plasmid for expression of a heterologous gene is effected by the simultaneous ligation, in phase, of (a) a first linear double-stranded DNA fragment contg. a replicon and a gene that expresses a selectable characteristic when placed under the direction of a bacterial promoter, the fragment lacking any such promoter, (b) a second linear double-stranded DNA fragment comprising the heterologous gene, and (c) a third double-stranded DNA fragment comprising a bacterial promoter.

The ligatable ends of the fragments are configured such that on ligation to form a replicable plasmid both the gene for the selectable characteristic and the heterologous gene come under the direction of the promoter, permitting use of the selectable characteristic in selection of transformant bacteria colonies capable of expressing the heterologous gene.

Prodn. of a polypeptide prod. by the expression in bacteria of a structural gene coding for it involves providing a bacterial inoculant transformed with a defined vehicle. Then the inoculant is placed in a fermentation vessel and grown in a nutrient medium contg. added tryptophan to regress the promoter-operator system, and then depriving the bacteria of the tryptophan additive to de-repress the system and to occasion the expression of the prod. for which the structural gene codes.

This procedure can be used in the high-yield prodn. of polypeptides such as human growth hormone, human proinsulin, somatostatin, thymosin alpha 1, the A chain or B chain of human insulin. Other techniques are described which are useful for prodn. of intermediates etc. (5pp)

Biological reactor drum filled with medium - is divided into four compartments with liq. flow between compartments on drum rotation

HANCOCK M C 04.08.80-GB-025382 (02.08.79-GB-026991)
(07.10.81) C02f-03/08

40.08.80 as 025382 (295DH)

Biological reactor includes a container packed with a medium for assisting the reaction. The container is divided by baffles which cause the liquid under treatment to intermittently cover portions of the medium. The medium not covered is exposed to gas within the chamber. Gas flow is prevented between one liquid covered portion of the medium and another. The container has separate liquid and gas inlets and separate gas and liquid outlets.

The appts. is for the aerobic or anaerobic treatment of organic waste waters but it may also be used as a reactor for other biological or chemical processes. (11pp Dwg.No.3)

MULL/ ★ D16 74336 D/41 ★ GB 2072-657
Prodn. of hulupone(s) from lupulone(s) - by oxidation and treatment with carbon dioxide under pressure

MULLER A 27.03.80-DE-011968
(07.10.81) C07c-49/59 C12c-03

19.05.80 as 016449 (955RS)

Hop prods. contg. alpha acids, and ground, crushed or ruptured lupulin seeds or hop extracts are mixed with adsorbents, and treated with supercritical carbon dioxide in a closed vessel (sic). Carbon dioxide leaving the vessel is subjected to reduced pressure to ppt. a base extract of hop oils and lupulones. The lupulones are mixed with adsorbents and converted to hulupones by oxidn. and treatment with carbon dioxide under press., and are purified to remove undesirable substances.

The process enables useless lupulones to be converted into bitter tasting hulupones useful for flavouring beer in good yields. (4pp)

NIOC ★ D16 74342 D/41 ★ GB 2072-670
Coprotoporphyrin and uroporphyrin sepn. and recovery - from culture broth contg. both

NIPPON OIL KK 25.03.80-JP-036882

B02 (07.10.81) C07d-209 C07d-257 C07d-487/22

20.03.81 as 008835 (476BJ)

Coprotoporphyrin (I) and uroporphyrin (II) are separated and recovered from a culture broth contg. them by adjusting the broth pH to 2.5-4, collecting the ppt. contg. (I) and (II) and preparing an aq. alkaline soln. of it, adjusting the pH of the soln. to above 4 but not over 6, collecting the ppt. contg. (I) and adjusting the pH of the remaining soln. to 1-4 and collecting the solid ppt. contg. (II).

Porphyrins have interesting physiological activity in regulating organs e.g. in improving liver function. Known methods for recovery of (I) and (II) are complex and not very efficient, and cannot be used for recovering them from a soln. contg. both, but the present method is easy to operate and gives a good separation. (5pp)

MATU ★ D16 74441 D/41 ★ J5 6106-148
Enzyme electrode mfr. - by attaching dehydrogenase and its coenzyme to electrical charge collector with a semipermeable membrane

MATSUSHITA ELEC IND KK 29.01.80-JP-009849

J03 (24.08.81) C12n-11 G01n-27/40

29.01.80 as 009849 (50WB)

Enzyme electrode comprises water-soluble covalent bound dehydrogenase and its coenzyme (e.g. nicotinamide adenine dinucleotide or nicotinamide adenine dinucleotide phosphoric acid) held and fixes onto the surface of an electricity-collecting material (e.g. graphite disc) by a semipermeable membrane which does not permeate the covalent bound material but permeates substrate of the dehydrogenase.

Prodn. of the electrode comprises (a) forming a layer of water-soluble covalent bound material of dehydrogenase and its coenzyme on the surface of electricity-collecting material and (b) applying a soln. of a semipermeable membrane-forming component onto the layer of the bound material and drying it to form semipermeable membrane layer.

The time required to attain a stationary current value is short, the increase in electric current is large, and analytical sensitivity is increased. The enzyme electrode is useful for quickly electrochemically determining the concn. of enzyme substrate. (5pp)

29.01.80 as 008363 (5AT)

The method comprises culturing the bacterial strain proteus which can produce glutathione-reductase (abbr. GTR), in common culture medium and recovering GTR from the bacterial body.

Examples of applicable bacterial strains are Proteus inconstans IFO 12930, P. vulgaris IFO 3045, P. mirabilis IFO 3849, etc. The culture is practiced at ca. 30 deg. C at pH 7-8 aerobically for 15-30 hrs. GTR accumulated in the bacterial body can be extracted by conventional means and crude extract obtd. is pptd. fractionally. The crude enzyme is further refined by absorption chromatography using 2',5'-ADP-Cephalose (RTM).

GTR catalyses the reaction of oxidised to reduced glutathione in the presence of NADPH and can be used for determining oxidised-form glutathione and NADPH in serum, etc. (5pp)

SHIO ★ D16 74478 D/41 ★ J5 6106-590
Galactose-oxidase fermentative prodn. - using Beltraniella protoricensis microorganisms

SHIONOGI KK 23.01.80-JP-007147

(24.08.81) C12n-09/04 C12r-01/64

23.01.80 as 007147 (5WB)

Method involves culturing a galactose-oxidase-producing Beltraniella microbial strain (MFC 0228) and recovering galactose-oxidase (GLO) from the cultured liquid. MFC-0228 produces GLO in amts. several times as high as conventional strains.

GLO catalyses the oxidn. of D-galactose to D-galactohexodialdose and can be used for detecting and determining galactose and galactose derivs. MFC-0228 is Beltraniella protoricensis (FERM- P5190). Cultivation is at 22-30 deg.C esp. ca. 25 deg.C aerobically by conventional method. GLO is recovered in high yield by column chromatography using ion exchange resin or fractional precipitating method using ammonium sulphate. (6pp)

UEDA- ★ D16 74479 D/41 ★ J5 6106-592
Refining vegetable beta-amylase - by contacting the amylase soln. with synthetic aluminium silicate adsorbent and eluting with phosphate buffer

UEDA KAGAKU KOG KK 24.01.80-JP-007483

B04 (24.08.81) C12n-09/26

24.01.80 as 007483 (5RP)

The method is effected by (a) contacting the soln. contg. beta-amylase from vegetables with synthetic aluminium silicate for adsorbing beta-amylase and (b) eluting beta-amylase with phosphate buffer opt. contg. common salt.

Synthetic aluminium silicate can be prepd. by adding soluble aluminium salt in aq. Na silicate soln. and washing and firing obtd. ppte. As the eluant phosphate buffer of pH 6.0-7.0 or the phosphate buffer contg. common salt 0.01-1 mol. pref. 0.05-0.2 mol. can be used.

Beta-amylase can be adsorbed on synthetic aluminium silicate efficiently and the elution can be practiced with only 1/10 amt. of eluant as that of crude enzyme soln. Thus obtd. enzyme soln. can be easily made germ-free by filtering using Chamberland filter. (6pp)

Coenzyme/Q10 prodn. by e.g. culturing Corynebacterium - useful as pharmaceutical for treating heart failure, pulmonary emphysema, etc. or as additive for feed

MITSUBISHI GAS CHEM IND 23.01.80-JP-006622

B05 (24.08.81) C12p-07/66 C12r-01/15

23.01.80 as 006622 (33RP)

Prodn. of coenzyme Q10 comprises cultivating a coenzyme Q10-producing strain of Corynebacterium or Xanthomobacter and recovering coenzyme Q10 from the mycelium.

The cultivation is effected in a medium comprising C sources, N sources, inorganic cpds., vitamins and/or amino acids at 20-45 deg. C, pref. 25-38 deg. C, within a pH range of 5-10, pref. 6.0-7.5. It is pref. to carry out the cultivation under aerobic conditions. Examples of the microorganisms used are Corynebacterium (Xanthomonas) autotrophicum DSM-431 and DSM-432. Coenzyme Q10 can be separated by extraction of the mycelium with methanol, ethanol, acetone, ethyl ether or a mixed solvent at room temp. or under heating at 40-90 deg. C.

Coenzyme Q10 is used as pharmaceuticals for treating heart failure, myasthenia gravis, pulmonary emphysema, aplastic anemia or alopecia areata or as additives to feed. The process gives coenzyme Q10 on large scale with economical cost. (4pp)

Determin. of hydrogen peroxide - by colorimetric method using oxidn.-condensate of aniline and 5-amino-salicylic acid with hydrogen peroxide

WAKO PURE CHEM IND KK 25.01.80-JP-007471

B04 (24.08.81) C12q-01/26 G01n-33/50

25.01.80 as 007471 (5RH)

Method comprises oxidn.-condensing N-hydroxy-alkylaniline cpd. (I) and 5-aminosalicylic acid with hydrogen peroxide in the presence of hydrogen peroxide-activator (e.g. peroxidase) and measuring the colour which the oxidn.-condensate reveals under alkaline condition. R1 is lower alkyl or hydroxy lower alkyl. R2 is hydrogen or lower alkyl. A is lower alkylene.

Formed colour is blue and has max. absorption at 630-640 nm and hydrogen peroxide in the samples taken from living body can be determined without any effects from colour originating from body liq. such as blood. The reagents are water soluble and stable. Thus, the method can be adapted for determining hydrogen peroxide, the activity of the enzyme which can produce hydrogen peroxide and the substance which forms hydrogen peroxide by the reaction with oxidising enzyme.

The oxidn.-condensing reaction proceeds at pH 5-9 and after the oxidising-condensn. the reaction mixt. is made alkaline with NaOH, etc. Method can be adapted for determining cholesterol, triglyceride, phospholipid, free fatty acid, uric acid, etc. in body liq. (5pp)

DAUC ★ D16 74700 D/41 ★ J5 6108-712
Activating agent for lecithin cholesterol acyl transferase - comprises pantethine and lecithin

DAIICHI SEIYAKU KK 31.01.80-JP-010737

B04 (28.08.81) A61k-31/68

31.01.80 as 010737 (5BZ)

Activating agent for lecithin-cholesterol-acyl transferase comprises pantethine and lecithin as active ingredients. The agent can also be used as drug for curing diabetes, arteriosclerosis, etc. by virtue of the activating ability.

The effect can be demonstrated when 0.1 g/ml of aq. soln. of pantethine is mixed with 10% aq. xylitol soln. and is injected into the patient. Patients suffering from kidney trouble or diabetes are injected with 1000 mg of pantethine. Before applicn. of the medicine and two hours after the applicn., the LCAT activity (lecithin-cholesterol-acyl transferase activity) is examined. Also, patients of kidney trouble is injected with pantethine 1000 mg and orally administered with 5 g of lecithin. Before and after application of the medicines, the LCAT activity is examined.

The results show that both patients suffering from kidney or diabetes show improved LCAT activity after administration of pantethine, but an even greater improvement when pantethine and lecithin were used together. (2pp)

SANW ★ D16 74702 D/41 ★ J5 6108-716
Antiviral compsn. for liq. preparations - contains dead cell bodies of microorganisms of Pneumococcus, Streptococcus, Pseudomonas etc.

Antibiotic antlermycin B and C - obtd. by culturing *Micromonospora* species on culture medium

RIKAGAKU KENKYUSHO 31.01.80-JP-010209

B04 (28.08.81) A61k-35/74 C07c-11 C12p-01/04

31.01.80 as 010209 (52KB)

Antlermycin B has the following properties: (i) elemental analysis: C 60.60%, H 7.24%, N 2.18%; (ii) mol. wt. (titration equiv.): 1260; (iii) m.pt. 210-214 deg.C; (iv) specific optical rotation: (v) specific UV spectrum; (vi) specific IR spectrum; (vii) solubility: very soluble in MeOH, EtOH, soluble in acetone, EtOAc, slightly soluble in Et₂O, CHCl₃, sparingly soluble in petroleum ether, water; (viii) colour reaction positive to c.H₂SO₄ (blue), KMnO₄, HIO₄-benzidine, 2,4-dinitrophenylhydrazine, o-dianisidine, and FeCl₃; pseudo positive to ninhydrin.

Gram positive bacteria including *Bacillus* (B. subtilis) and *Micrococcus*. Antlermycin C is also claimed. (10pp)

NDEN ★ D16 74925 D/41 ★ J5 6109-585
Crosslinking method for microbial membrane - by treating microbes dispersed in collagen membrane with glutaraldehyde soln. in phosphate buffer

NISSHIN ELECTRICAL KK 01.02.80-JP-011655

J04 (D15) (31.08.81) C12n-11/06 G01n-27/40

01.02.80 as 011655 (5RH)

Method comprises crosslinking microbial membrane which is prepd. by dispersing microbes in collagen membrane, with the glutaraldehyde soln. obtd. by dissolving glutaraldehyde 0.08-0.12% in 0.1M phosphate buffer soln., at 19-30 deg. C for 45-75 secs. and washing it with 0.1M phosphate buffer soln.

The collagen microbial membrane can be strengthened sufficiently while maintaining the activity of the microorganisms. Thus treated microbial membrane can be used in combination with dissolved oxygen electrode to prepare the microbial electrode which can be used for determining BOD and for judging the toxicity of soln. and the possibility of the microbial treatment of soln. (2pp)

KYOW ★ D16 74926 D/41 ★ J5 6109-587
Genetically recombined *Corynebacterium* microbial strain prepn. - by forming protoplasts from cultured bacterial cells, stabilising, effecting plasmogamy

KYOWA HAKKO KOGYO KK 06.02.80-JP-013403

B04 (31.08.81) C12n-15 C12r-01/15

06.02.80 as 013403 (5RP)

The method is effected by (a) forming protoplasts from cultured bacterial cells and stabilising then, (b) effecting plasmogamy between protoplasts, (c) reclaiming blended protoplasts to normal cells and (d) selecting thus obtd. recombined strains.

The formation of protoplast is practiced by culturing the bacterial strain under the condition that the cells become sensitive to lysozyme and treating the cells with lysozyme. For making the cells sensitive to lysozyme, various inhibitors for the formation of cellular membrane (e.g. penicillin) can be used. The plasmogamy is practiced by mixing the protoplasts which are derived from different parent strains and treating the mixt. with polyethyleneglycol. Duplicated varieties which belong to *Corynebacterium* and

show high producibility for amino acids and their analogues, can be prepd. by the simple process. (6pp)

MITU ★ D16 74930 D/41 ★ J5 6109-594
5-Beta-3-one steroid prodn. - by delta 4 steroid redn. with *Streptococcus* microorganisms using 3-one-4-ene steroid as substrate

MITSUBISHI CHEM IND KK 05.02.80-JP-012784

B01 (31.08.81) C12p-33/02 C12r-01/46

05.02.80 as 012784 (108WB)

Redn. of delta 4-steroid comprises using as substrate 3-one-4-ene-steroid and culturing microorganism belonging to the genus *Streptococcus* to produce 5 beta-3-one-steroid in which C4-5 position is satd.

The *Streptococcus* microorganism is, e.g. *S.faecalis*, esp. *S.faecalis* MCI-1091(FERM-P-5260). Pref. steroids to be reduced are 4AD, teststerone, ADD, predonisolone, etc. Redn. can be conducted using either growing cells or resting cells. INTRODUCTION of a large amt. of air inhibits the redn. Cultivation is conducted at 20-40 deg.C, pref. 25-37 deg.C. The pH is 5-10, pref. 6-9. The concn. of cells is 1 x 10 power 8/ml or more, more than 1 x 10 power 9/ml.

C4-5 position of 3-one-4-ene-steroid can be reduced in high yield and in short time. The obtd. cpd. is useful as intermediate for the prepn. of various steroid hormones and vitamin D₃. (11pp)

HITA ★ D16 74932 D/41 ★ J5 6109-596
Microbial body concn. measurement - by determining nitrogen consumption e.g. by Kjeldahl method

HITACHI KK 01.02.80-JP-010053

B04 (31.08.81) C12q-01/06 C12r-01

01.02.80 as 010053 (5AT)

Microbial body concn. in culture liq. is measured by determining the amt. of nitrogen consumed by the culture and calculating the amt. of microbial body from the nitrogen content of microbial body determined previously. The amt. of nitrogen consumed by the culture can be calculated from the amt. of nitrogen contained in the culture liq., from which microbial body is previously removed and the amt. of nitrogen added to the culture liq.

The nitrogen can be determined e.g. by CHN-analyser, TN-analyser, Kjeldahl method, etc. The nitrogen content in microbial body depends on the microbes and is almost constant during the culture. The nitrogen content of bacteria, yeast and mould is 8-15 w/w%, 5-10 w/w% and 2-7 w/w% respectively.

By this method the microbial body concn. even in the culture liq. obtd. by high microbial body concn.-culturing can be rapidly measured exactly. (4pp)

Cellulose 212 (I) which has an optimum Avicel-solubilising activity at pH 5-8, is prepd. by aerobic culturing of Aeromonas Sp. 212, FERM-P 2306, ATCC 31085 in a nutrient medium contg. N- and C-sources as well as cellulose material, at pH 6-10. Cellulose 212 and hemicellulase 333 which may also be produced, are novel products. (I) can decompose natural celluloses and hemicellulase (II) can decompose straw food- and feedstuff residues. Both are active at pH 4.5-8.5, esp. 6.0-8.0.

They may be used in crude form separately or combined, as cleaning agents, in the decompn. of waste-waters and excrements. In purified form (I) and (II) may be used in foodstuffs and medicaments. Both enzymes have alkali-stability not present in known enzymes and are very active against cellulose materials. They are obtd. in high yield. (J50076287) (6pp)

TEIJ D16 09076 B/05 = J8 1039-192
High purity urokinase prepn. - by contacting aq. urokinase soln. with diethylamino cellulose, then with adsorbent of heparin deriv.) and polysaccharide

TEIJIN KK 26.05.77-JP-060520

A97 B04 (11.09.81) *J53145-983 + C12n-09/72

26.05.77 as 060520 (BZ)

The method comprises (1) bringing an aq. urokinase soln. having an electric conductivity of 15-5 mmho, in contact with diethylaminocellulose, (2) adjusting the electric conductivity of the non-adsorbed fraction to 8-4 mmho, (3) bringing so adjusted soln. in contact with an adsorbent prepd. by chemically binding heparin or its alkali metal salt with an insoluble polysaccharide carrier, and (4) eluting the adsorbed urokinase with an aq. soln. having an electric conductivity of 50-18 mmho.

The insoluble polysaccharide may be agarose, sephanrose or dextran. Binding of heparin or its alkali metal salt to such polysaccharide may be performed by the aid of cyanogen bromide or soluble carbodimides in conventional manners. For the final elution an aq. soln. of a weak acid is used.

JAAT D16 29068 X/16 = J8 1039-193
Polymer compsn contg enzymes or microorganisms prodn - by polymerising monomer dissolved in aq soln or dispersion of enzymes or microorganisms

JAPAN ATOMIC ENERGY RES 30.08.74-JP-099756

A97 (11.09.81) *J51026-285 + C12n-11/04

20.08.74 as 099756 (NS)

In an aq. soln. of enzymes (or an aq. dispersion of microorganisms), at least one polymerisable monomer selected from monomers of formulae (I) and (II) is dissolved. The monomer is then polymerised at a controlled temp. not exceeding 40 deg.C to produce a solid polymer in which the enzymes (or microorganisms) are included. Any known polymerisation process is applicable, but radiation-induced polymerisation is pref.

CH₂:CX-C(O)-(O-R)_n-OR' (I)

CH₂:CX-C(O)-(O-R)_m-C(O)-CX:CH₂ (II)

(X is H, methyl, or halogen; R is -CH₂CH₂-, -CH(CH₃)-, -CH₂-, -CH₂-CH(CH₃)- or -CH₂CH₂CH₂-; R' is H or alkyl, n is a number not greater than 2; and m is a number not greater than 4). Highly porous polymer/enzyme (or microorganism) compsn. is obtd. without drying-, washing-, or grinding operation for increasing porosity.

The prod. can be used for enzyme reaction purposes without additional treatment. (J51026285) (6pp)

TAKE D16 22370 A/12 = J8 1039-194
Fermentative prodn. of D-iso: citric acid - by culturing e.g. *Candida lipolytica* ATCC 20114 in a medium contg. normal-paraffin, salts and itaconic acid

TAKEDA CHEMICAL IND KK 10.06.74-JP-066326

(+)-isocitric acid (I) is fermentatively produced by yeasts in the presence of itaconic acid (II). (I) is a food additive.

In an example, *Candida lipolytica* ATCC 20114 was pre-cultured and aerobically main-cultured on a medium contg. 8% n-paraffin salts, and 0.01 M (II), at pH 3.5. Amts. of (I) accumulated were 1.50 and 87.2 g/l. after 19 and 72 hrs. but 0.09 and 36.4 g/l. respectively, without (II). (J50155683) (8pp)

MASI D16 88536 Y/50 = J8 1039-197
Test method for detecting mutagenesis - based on the use of human diploid cells

MASSACHUSETTS INST TECH 24.05.76-US-689432

B04 S03 S05 (11.09.81) *DE2723-185 + C12q-01/02

23.05.77 as 059692 (367KB)

Test method for determining the mutagenic properties of a substance comprises first contacting a culture of human diploid (or approx. diploid) cells with the test substance. The treated cells are then incubated until sufficient generations have developed from them to manifest pheotypic resistance to a purine which acts as a hypoxanthine-guanine-phosphoriboyl transferase (HGPR T) substrate. The fraction of mutant cells is then determined. Also claimed is an active metabolising system esp. suitable for use in the test to determine the mutagenic effect of metabolites of the test substance.

The method is based on the fact that a long time (phenotypic lag) is required for mutagenesis to show up in human diploid cells. Its advantage over methods using cells of lower mammals is that human-specific mutagenic effects can be detected. (J52143278) (14pp)

BOEF D16 81194 Y/46 = J8 1039-198
Substrates compsn. or enzymatic activity evaluation - using redox reaction, in the presence of ascorbate-oxidase

BOEHRINGER MANNHEIM GMBH 09.06.76-DE-625834

B04 J04 S03 (S05) (11.09.81) *BE-854-407 C12q-01/26

06.05.77 as 051953 (395WB)

Process for the determination of substrates of for measuring enzymatic activity by use of oxido-reduction reactions is effected in the presence of ascorbate-oxydase.

Oxido-reduction reactions are used for determining the concns. of enzymes or substrates e.g. using photometric methods to express the results. The use of ascorbic-oxydase to oxidise the ascorbic acid to dehydroascorbic acid and water avoids the interference of ascorbic acid. (J52150692) (10pp)

KURE D16 79384 A/44 = J8 1039-288
Increasing antibiotic activity against resistant bacteria - using a nitrogen-contg. polysaccharide extracted from *Coriolus mycelium*

KUREHA CHEM IND KK 13.04.77-JP-041513

B04 (11.09.81) *NL7803-875 A61k-35/84

13.04.77 as 041513 (367AS)

The sensitivity of resistant bacteria to antibiotics is increased using an N-contg. polysaccharide (I) which can be obtd. by extracting the mycelium of a basidiomycete of the genus *Coriolus* (family Polyporaceae) with an aq. solvent and working up the extract. (I) has a mol. wt. of 500-300000, contains 42.0-46.0% C, 5.3-7.0% H and 0.5-8.0% N, has a specific rotation between 0 and +50 deg.C., is readily soluble in H₂O but insoluble in acetone, pyridine, CHCl₃ and hexane, and has characteristic IR absorption bands at ca. 840 and 890 cm⁻¹).

(I) can be administered in association with a wide range of antibiotics, (e.g. penicillins, cephalosporins, tetracyclines, streptomycin, kanamycin and chloramphenicol) to increase the strength and duration of their activity against various resistant strains of e.g. *Staph. aureus*, *E.coli*, *Saln enteritidis*, *K.pneumoniae*, *Shigella sonnei*, *Ps.aeruginosa*, *Strept. faecalis*, *Proteus mirabilis* and *Enterobacter aerogenes* (J53127813) (11pp)

AGEN D16 13617 C/08 = J8 1039-631
Alpha-1,6-glucosidase prepn. - by cultivating *Bacillus* bacteria in medium contg. manganese and iron ions to increase yield

AGENCY OF IND SCI TECH 06.06.78-JP-067980

06.06.78 as 067980 (5BZ)

Method comprises culturing alpha-1,6-glucosidase-producing *Bacillus* bacteria in a culture medium contg. manganese ions and iron ions.

Pref. the amt. of manganese ions and iron ions are 1 x 10 power minus 6 - 1 x 10 power minus 3 M and 1 x 10 power minus 5 - 1 x 10 power minus 4 M respectively. *Bacillus cereus* var. *mycoides* FERM-P 2391 is pref. used. The yield of alpha-1,6-glucosidase can thus be increased 6-7 fold. (J55003703) (4pp)

MOMI D16 91659 B/51 = J8 1039-632
Enzymatic prepn. of aldehyde from amino acid and polyphenol - using a polyphenol oxidase obtd. from *Alternaria* or *cladosporium* microorganism

MORINAGA & CO LTD 27.04.78-JP-050585

B05 E16 (14.09.81) *J54143-591 + C12n-09/02 C12p-07/24 C12r-01/64

27.04.78 as 050585 (5BZ)

Method comprises contacting a polyphenol-oxidase produced by a polyphenoloxidase-producing microorganism belonging to *Alternaria* or *Cladosporium*, with a reaction mixt. contg. amino acid and polyphenol. Examples of the reaction mixt. are green tea extract, cacao bean extract, coffee bean extract or their combinations, with amino acids.

Pref. microorganism is *Alternaria tenuis* A-2 (FERM P-332) which is aerobically cultivated at 30 deg.C. Acetaldehyde, i-butylaldehyde, i-valeraldehyde, 2-methylbutanal, methional, phenylacetaldehyde, etc. can thus be formed from alanine, valine, leucine, i-leucine, methionine, phenylalanine, etc. respectively.

Thus formed aldehydes are aromatic substances which are used for enhancing flavour. (J54143591) (3pp)

IDEK D16 60550 B/33 = J8 1039-634
Glutathione-contg. liquor prodn. - by adding liquor contg. (hydroxy) carboxylic acid to yeast fungi and extracting resultant mixt.

IDEMITSU KOSAN KK 15.12.77-JP-149958

B05 E16 (14.09.81) *J54084-093 + C12p-21/02 C12r-01/86

15.12.77 as 149958 (69DJ)

Process comprises adding liquor contg. at least 1 aliphatic carboxylic acid or aliphatic hydroxycarboxylic acid to yeast fungi body and extracting resultant mixt. at less than 40 deg.C. Pref. acid used is formic, acetic, propionic, butyric, valeric, oxalic, glycollic, citric, lactic, malonic, tartaric and/or tatrionic acid.

Pref. acid concn. of mixt. after addn. of liq. to yeast fungi body is 2 wt.% water content greater than 5 wt.% and pH is less than 2. When the (hydroxy)carboxylic acid used is solid at ordinary temp., it is used as mixt. with water and/or organic solvent. The organic solvent is pref. a hydrophilic solvent such as methanol, ethanol or acetone. The yeast is e.g. baker's yeast. (J54084093) (3pp)

NISR D16 25684 D/15 = J8 1039-635
Selective media for detection of cholera bacteria - contg. mannose, dye, polymyxin B, surfactant and tellurite

NISSUI PHARM KK 25.09.79-JP-122806

B04 (14.09.81) *DE3007-579 C12q-01/04

25.09.79 as 122806 (367DJ)

Selective growth media for isolation and detection of cholera bacteria contain mannose, a sulphophthalein dye (I), polymyxin B (II), a surfactant, and K tellurite (III).

The media pref. contain 1.5-2.5% mannose, 0.002-0.008% (I), 100,000-200,000 U/l of (II), 0.009-0.25% surfactant and 0.00008-

0.00015% (III). The surfactant is pref. Na lauryl sulphate or Na heptadecyl sulphate. (I) is pref. bromothymol blue, thymol blue, cresol red or phenol red.

The media are more sensitive and selective (do not give false positive results with non-agglutinating *Vibrio* spp) than thiosulphate-citrate-gallate-agar and *Vibrio* agar media. (J56048897) (3pp)

MARU- D16 26538 C/15 = J8 1039-836
Reagent for determin. of guanase - comprises 8-aza:guanine or guanine as substrate and N,N-bis-2-hydroxyethyl-glycine

MARUHO KK 25.08.78-JP-104239

B04 (14.09.81) *J55029-985 C12q-01/34

25.08.78 as 104239 (140JB)

Reagent for determin. of guanase which is clinically useful for diagnosis of liver disorders comprises a substrate buffer contg. 8-azaguanine or guanine as a substrate and N,N-bis(2-hydroxyethyl)glycine (BHG) of formula (I).

BHG helps dissoln. of the substrate without adversely affecting the enzymatic reaction system. Use of this reagent gives more accurate guanase levels than the conventional methods, partic. when determin. is conducted in combination with colourimetric NH₃ determin.

Pref. molar ratio of BHG to substrate is 1:30. A suitable substrate concn. is about 1.3 mM. In a direct ammonia colourimetric determination, the enzymatically released NH₃ is changed to indophenol by the action of phenol, sodium nitroprusside and sodium hypochlorite, and a developed blue colour is determined as absorbance at 630 nm, from which the enzymatic activity is obt'd. (J55029985) (5pp)

ABBO D16 10637 A/06 = J8 1039-837
Alpha-amylase enzymatic determination - in e.g. serum or urine using modified starch substrate and phosphorylase, phosphoglucomutase and glucose 6-phosphate dehydrogenase

ABBOTT LABORATORIES 01.07.76-US-701778

B04 S03 S05 + P31 (14.09.81) *DE2729-636 + C12q-01/40

29.06.77 as 076684 (280KB)

In the determin. of alpha-amylase in a sample, the sample is incubated with a modified starch substrate contg. masked, non-reducing terminals in the presence of a suitable phosphorylase, phosphoglucomutase and glucose 6-phosphate dehydrogenase as coupling enzymes for measuring the non-reducing terminals freed under the influence of the alpha-amylase.

New reagent for the determination of alpha-amylase in a sample contains: 20-100 mmol/l phosphate buffer pH 6-8; 1-5 mmol/l Mg salt; 0.01-0.5 mmol/l adenosine 5'-monophosphate; 1-5 mmol/l, nicotinamide adenine dinucleotide; 0.1-5 umol/l glucose 1,6-diphosphate; 2-100 mmol/l NaCl; 2-5 g/l 4% periodate oxidised NaBH₄-reduced starch; 8-30 U/ml rabbit muscle phosphorylase b; 1-10 U/ml phosphoglucomutase; and 5-50 U/ml glucose 6-phosphate dehydrogenase.

Used for determin. of alpha-amylase in biological fluids such as serum or urine. (J53003891) (4pp)

NISY D16 16953 A/09 = J8 1039-878
Digestion of polyvinyl alcohol resin(s) - by incubating with a strain from *Staphylococcus* in medium contg. acetic acid, an acetate and/or an acetate ester

NIPPON SYNTH CHEM IND 06.07.76-JP-080616

A14 (A35 D15) (16.09.81) *J53006-481 C12r-01/44 + C02f-03/02 C12n-01/20

06.07.76 as 080616 (42RH)

Digestion of polyvinyl alcohol resin (I), comprises incubation of a microorganism (II) belonging to *Staphylococcus* in a culture medium contg. (I) and at least 1 of acetic acid (III), acetate salts (IV) and acetate ester (V) as carbon sources.

Used for treatment of waste water contg. (I). Digestion of (I) is promoted by the addn. of one or more of (III), (IV) and (V).

The concn. of (I) in the culture medium is 0.005-1wt.%, e.g. (0.01-0.2wt.%) and the concn. of the sum of (III), (IV) and (V) is 5-500 wt.%, e.g. (20-300wt.%), w.r.t. (I). Examples of (IV) are sodium and potassium acetate and examples of (V) are methyl, ethyl, propyl and butyl acetate. The temp. and pH of incubation are 20-37 deg. C and 6.0-8.0 respectively. An example of (II) is *Staphylococcus aureus* (IFO 3060). (J53006481) (3pp)

Substrates compsn. or enzymatic activity evaluation - using redox reaction, in the presence of ascorbate-oxidase
BOEHRINGER MANNHEIM GMBH 09.06.76-DE-625834
B04 J04 S03 (S05) (17.01.81) *BE-854-407 C12q-01/26
06.05.77 as 481956 (395WD)
Process for the determination of substrates or for measuring enzymatic activity by use of oxido-redn. reactions is effected in the presence of ascorbate-oxidase.
Oxido-redn. reactions are used for determining the concns. of enzymes or substrates, e.g. using photometric methods to express the results. The use of ascorbic-oxidase to oxidise the ascorbic acid to dehydro ascorbic acid and water avoids the

Interference of ascorbic acid. Bul. 2/15.1.81. (6pp)

HEAL = ★ D16 75254 D/41 ★ SU-797-662
Bronchial pneumonia simulation - by administration of mixt. of formaldehyde in air, followed by intranasal dose of haemolytic staphylococcus and treatment at low temps.
HEALTH RESORT PHYSI 17.01.79-SU-733269
B04 J04 P31 P85 (28.01.81) A61b-10 G09b-23/28
17.01.79 as 733269 (1471WD)
The spread of model bronchial pneumonia is increased and the pathology is brought closer to its clinical symptoms in people, by admin. of formaldehyde in form of an air mixt. (conc. 12-17 mg/l) over 3-4 days, at 1.5-2 hours intervals, followed by intranasal admin. of haemolytic staphylococcus culture and subjecting the laboratory animals to 4-7 deg.C. temp., for 90-120 mins.
White rats are subjected to inhalation of air-formalin mixt. daily for 1.5 hours for 4 days. After the inhalation course, the animals under ether anaesthesia are treated with intranasal dose of 0.7 ml. of aq. suspn. of haemolytic staphylococcus strain 209 (2 billions of microbe bodies in 1 ml.). Then 15 min. after the admin. of the bacteria the animals are subjected to temps. of 4 deg.C. for 2 hrs. The animals are killed 7 days later.
In all the animals, bronchial pneumonia in the state of red hepatisation is observed predominantly in the left lung (12-56%), but also in the right lung-tip, diaphragmatic part (41%) and in the accessory part (24%). Lower one-sided and both-sided bronchial pneumonia is also registered in 13-28%.
Microscopic research of the histological slices of the lung tissues shows atelectatic bronchial pneumonia with desquamation components and polypheration of alveolar and bronchial epithel, alteration of alveoles and small bronchial and excudation and also mucopurelant cattarrh, desquamato-mucoid bronchitis and peribronchitis. Bul. 3/28.1.81. (2pp)

Infectious bovine rhinotracheitis vaccine prepn. - by growing virus on bovine lung cells and recovering viral envelope protein by soln. in aq. nonionic surfactant
IOWA STATE UNIV RES INC 02.05.80-US-146141 (09.07.79-US-055821)
B04 C03 (22.09.81) A61k-39/26
02.05.80 as 146141 (916HM)

Parenterally injectable infectious bovine rhinotracheitis (IBR) vaccine is prepd. by cultivating virulent IBR virus in a cell culture medium, collecting the cells and contacting them with a soln. of a non-ionic detergent. This dissolves the viral envelope protein which is then sepd. for use as a vaccine.

The virus is preferably the virulent Cooper strain normally used as a challenge strain. The cells used are bovine lung cells grown on Eagle's minimum essential medium supplemented by 10% irradiated calf serum, 0.5% lactalbumin hydrolysate and antibiotics and buffered with 0.16% sodium bicarbonate, and 8 mM N-2-hydroxy-ethylpiperazine-N'-2-ethanesulphonic acid. Incubation temp. is 37 deg.C and the atmos. contains 5% carbon dioxide.

This vaccine gives a higher antibody response than those of prior art. It may be administered to cattle including calves pregnant cows, oxen and water buffalo. (7pp)

Inactivation of non-A, non-B hepatitis virus agent with formalin - for prodn. of vaccine against non-A, non-B hepatitis
US SEC OF HEALTH 16.05.80-US-150320
B04 (22.09.81) A61k-39/29
16.05.80 as 150320 (1248MR)

Treatment of an agent of human non-A, non-B hepatitis virus is with formalin at a concn. of 1:1000-1:10000 for 24-120 hrs. to inactivate the agent.

The inactivated agent (I) can be used for a vaccine against non-A, non-B hepatitis, as it induces an immune response. (I) is responsible for non-A, non-B hepatitis infections in post-transfusion episodes in different areas of the U.S. It is transmissible to humans and chimpanzees and it may be serially passaged in chimpanzees; it may remain in blood for prolonged periods.

Pref. formalin as an aq. 37-50% soln. opt. contg. 15% MeOH is used. Suitably formalin at 1:1000 is used for 96 hrs. at 37 deg.C plus or minus 4 deg.C. The lack of infectivity of the treated virus is tested by inoculation of a chimpanzee.

For use in a vaccine the agent may be combined with an adjuvant. (3pp)

28.08.79 as 070460 (924MR)

Recovery of an antibiotic trans-BM123V pamoate complex from a fermentation whole harvest mash comprises (a) producing a fermentation liquor by clarifying the whole mash, (b) adding a water soluble pamoate salt selected from ammonium and alkali(ne earth) metal pamoates or their mixts. while maintaining the liquor at pH 4-8 by addn. of acid or base, (c) removing the pptd. antibiotic complex, and (d) drying the obtd. prod.

Pref. pamoate salt is NH₄, Na, Mg or Ca pamoate. The highly stable complexes are useful as animal feed supplements which significantly enhance the growth rate of animals and poultry. Feed supplement comprises are administered in amt. sufficient to furnish dosage levels of 350 mg/head/day for large ruminants and 100 mg/head/day for non-ruminants. (6pp)

NADI * D16 75639 D/41 ★ US 4291-124
Continuous fermentation of sugars to ethanol - using sugars prepd. by acid hydrolysis of carbohydrate polymers
NATIONAL DISTILLERS CORP 12.03.80-US-129518 (25.06.79-US-052038)
(22.09.81) C12p-07/14
12.03.80 as 129518 C.i.p. 4242455 (478HM)

Process for the acid hydrolysis of carbohydrate polymers (I) and the continuous fermentation of the produced fermentable sugars (I) to EtOH is as follows: (a) a pressurised acidified aq. slurry is passed through a conduit under steady state temp./ pressure to convert at least 60% by wt. of (I) to (II) (but no conversion to non-fermentable prods.); (c) pressure of the slurry is reduced so that undesirable side-reactions of (II) cannot occur; (d) (II) (pH adjusted; partial hydrolysate opt. further saccharified) is continuously fermented in a series of vessels in which the EtOH concn. is progressively increased. The fermentation uses at least 2 strains of EtOH-producing yeast: (i) one which gives a high rate of EtOH prodn. in media contg. low EtOH concns. but high (II) concns., and (ii) one which affords a high rate of EtOH prodn. in media contg. high EtOH concns. but low (II) concns. This is a c.i.p. of US4242455.

The acid hydrolysis of (I) is effected at rapid and high conversion levels without significant degradation of the produced (II). In addn., the thermally efficient, rapid, continuous fermentation affords industrial EtOH at competitive prices. (10pp)

MERI * D16 75649 D/41 ★ US 4291-156
Hetero-polysaccharide S-53 thickening agent - useful for thickening paints etc., prepd. from aerobic culture of *Klebsiella pneumoniae*

Extn. of sugar from suspension of bagasse in washing juice - includes passing screened bagasse through filter band press
FIVES-CAIL BABCOCK 29.02.80-FR-004532 (11.04.74-FR-012706)
(04.09.81) C13d-01/04
29.02.80 as 004532 Add to 11.4.74-012706 (448RH)
Parent patent described a process and an installation for extn. of sugar from bagasse. The installation has a diffusion stage which includes a mixing tank in which bagasse is put into suspension in washing juice. The suspension is passed through a deaerator and then via a high speed pump to a separator. Drained bagasse from

the separator is passed through a press to extract more juice and the bagasse then transferred to a subsequent diffusion stage or to a sugar cane mill.

In this addn., the press is now a filter band press, pref. corising upper and lower endless filter bands between which the bagasse is progressively squeezed as conveyed. The separator pref. comprises a perforated screen, inclined to the horizontal. The upper half of the screen is hinged to the lower half to permit relative angular adjustment.

The filter band press is less costly than cylinder presses and high pressure mills previously employed. The operating pressure is lower but can be exerted over a long, conveying path. (7pp)

Chitosan-based spun (or moulded) prod. is produced by coagulating aq. soln. of chitosan or salt in coagulating bath composed of aq. soln. contg. alkaline substance (pref. alkali metal hydride).

The process is used to produce fibre, film, etc., from chitosan, which is obtd. by alkali hydrolysis of chitin. The alkaline coagulating bath permits decomposition of chitosan salt and coagulation of liberated chitosan in one step. Alkali salt accumulating in the bath promotes coagulation of chitosan.

In an example, an aq. dope contg. 3.0 wt.% chitosan and 0.5 wt.% acetic acid was degassed at 60 deg.C and 15 mm Hg. The dope was then extruded through orifices into 5 wt.% aq. NaOH soln. maintained at 30 deg.C. Equilibrium pH of the bath was 10.2. The filaments were passed through the bath over the length of 200 cm, at a draft of about 2.0, and then washed with water at 40 deg.C., and subsequently with boiling water. The resulting chitosan filaments had single fibre size of 3.05 denier, tensile strength 2.44 g/d, elongation 10.8% and knot strength 1.75 g/d. (3pp)

E34 P15 (E32) (16.09.81) *DE2263-178 + A24d-03/16 B01d-25/04 B01d-39

26.01.73 as 001195 (510TM)

A filter for tobacco smoke is prepd. by (a) impregnating a fibrous substrate with a suspension of ZnO and Na and/or K carbonate, in molar ratio of 25:1-1:25 (8:1-1:5) in a plasticiser, to deposit at least 30 mmols. of the suspension on the substrate, and (b) forming filters from the impregnated material. The suspension pref. contains 90-80 wt.% of the plasticiser and 10-40% of ZnO + carbonate.

Plasticisers include triethylene glycol diacetate, ethylene citrate and glycerol triacetate. The amt. used is esp. 2-25 (3-10) mg. of ZnO + carbonate per cigarette. The dispersion is stable for at least 5 days, and can be sprayed. HCN and H₂S are selectively removed. (10pp)

Loading hide stretching frames into drying tunnel - by elevating carriage simultaneously receiving frame from tunnel
VILJANMAA AK 20.03.80-FI-000861
(01.10.81) C14b-01/26

20.03.81 as F10022 (295AT) (E) SE-397683 DE1263979 DE2307089 N(BR) E(AT CH DE FR GB JP NL SE US)

A hide is stretched on a frame which is provided with wheels. These wheels support the frame while it is advanced through a drying tunnel by a system of rails. The feed to the drying tunnel is vertically adjacent and beneath the exit from the tunnel. A hide frame can be elevated from a loading table to the inlet to the tunnel and is advanced onto the tunnel roll by a pusher arm. Simultaneously a dried hide and frame are discharged from the tunnel onto the elevator.

The hide frame elevator includes a set of gates which allow the frame discharged from the tunnel onto the elevator.

The hide frame elevator includes a set of gates which allow the frame discharged from the tunnel to be lowered into alignment with the tunnel feed rail.

The appts. loads a drying tunnel with stretched hides. Simultaneous feeding and discharge of the drying tunnel increases the efficiency of operations. (11pp)

Dyeing hair with azo developing dye - by applying cream contg. coupler and diazonium salt, then alkaline shampoo
HENKEL KG AUF AKTIEN 14.03.80-DE-009833
E21 (01.10.81) A61k-07/13 D06p-03/14

14.03.80 as 009833 (1251RP)

Method for dyeing hair with azo development dyes comprises applying to the hair a cream of pH about 4.5 contg. a coupler (I) and a diazonium salt (II). When the cream has penetrated the hair sufficiently, a shampoo of pH about 9 is applied to render the dye comps. on the hair alkaline so that coupling occurs. The hair is then thoroughly rinsed and dried.

(I) is imidazole; 2,4-dihydroxyquinoline; dimedone; 1,2-pyrido-4,6-dioxypyrimidine, 1,3-indanedione or esp. 2-amino 3-hydroxypyridine (Ia). (II) is pref. a stabilised monoamine deriv., and the initial cream pref. contains 0.2-10(1-5) wt. % (I) plus (II) (on the basis of the total comps.) The method is simpler (fewer stages) than the known method in which (I) and (II) are applied separately. (11pp)

FARB * D21 73880 D/41 ★DE 3010-373
Polymerisation of methyl methacrylate with enol ether - as mol. wt. regulator, avoiding mercaptan(s), esp. for dental prosthesis
BAYER AG 18.03.80-DE-010373
A14 E15 (A60 A96) (01.10.81) C08f-20/14

18.03.80 as 010373 (510RH)

Methyl methacrylate is polymerised, or copolymerised with up to 25 wt. % of a vinyl monomer, in presence of 0.01-10 (0.05-1) wt. % of an enol ether from a (cyclo)aliphatic aldehyde or ketone.

The enol ether acts as mol. wt. regulator, avoiding the smell and oxidisability of mercaptans. The ether also acts as heat

stabiliser in the polymer. The polymer is esp. used for injection moulding, partic. for prodn. of dental prostheses by the powder/liq. process.

Claimed co-monomers are 2-20C alkyl methacrylates, 1-20C acrylates, styrene and 1-4C alkyl-substd. styrenes, and (meth)acrylonitrile, pref. 2-15C methacrylates and/or 1-8C acrylates. Pref. enol ether is of formulae (I)-(V) where R' and R are H or 1-5C alkyl; and R is 1-20C alkyl, 5-10C cycloalkyl, or 7-20C aralkyl. (23pp)

BEGO- * D21 73915 D/41 ★DE 3011-098
Precision casting, esp. of metal dental prostheses - where vacuum is suddenly applied to mould cavity so dense castings with fine surface detail are obtd.

BEGO BREMER GOLDSCH 22.03.80-DE-011098
M22 S05 P32 P53 (01.10.81) A61c-13/20 B22d-18/06
22.03.80 as 011098 (1144RH)

The process and plant consists of a mould with a runner funnel, in which a mouldable or castable mass, esp. a metal or alloy, is placed. The funnel stem forms an ingate leading to a mould cavity which has a small dia. pipe in its base. After the castable mass has been melted, a vacuum is suddenly applied to the small dia. pipe via a vacuum reservoir, so the melt flows into the

...vity at high speed.
A pref. mould includes a runner funnel surrounded by an induction heating coil employed to melt metal in the funnel. The small dia. vacuum pipe is not wide enough so it is entered by the molten metal but this pipe may also be surrounded by a cooling oil.

A simple appts. with low energy consumption, where the porosity of the mould has no significant affect on the vacuum due to the use of a reservoir. (21pp Dwg.No.5)

Freeze dried collagen prod. for medical or cosmetic use - heat treated or treated with gaseous hydrogen halide after freeze drying

PENTAPHARM AG 08.10.79-CH-009030
B04 (D22) (30.09.81) *WP8100-963 A61k-37/12 C08h-01 C09h-01
17.09.80 as 901717 Based on WP8100963 (1251HM) (G) US4066083
DE2625289 DE1692548 FR2369329 GB1144552 FR2108068 DS-673203 E(FR)

A collagen prod. (A) is made by first comminuting appropriate animal tissue at not over 40 deg. C, then repeatedly treating with 5 vol.pts. 5-15wt.% aq. NaCl soln. contg. 0.2-1 wt.pt. NaN₃ preservative per 1000 wt.pt. soln. and 0.5-2wt.pt. nonionic wetting agent (capable of emulsifying fats). The resulting fibrous prod. is free of fat and unwanted water-soluble non-collagen components and is washed with water or 0.1-0.5% formic, acetic or citric acid.

The prod. is treated for 8-48 hr. at pH 2.5-3.5 in 5 vols. 0.1-5% aq.

acetic acid contg. 1wt.pt. pepsin per 1000 wt.pt. starting tissue to remove non-collagen proteins and telopeptides. The resulting collagen suspension is pptd. by adding NaCl to 3.5%, and the prod. desalted by ultrafiltration, dialysis or washing with aq. 60-75% ethanol. It is then dissolved in demineralised or distilled water contg. up to 3wt.% volatile, strong, organic acid to give a soln. of collagen concn. (dry residue) 0.5-2wt.% which is freeze-dried then sterilised.

The new feature is that after freeze-drying but before or after sterilisation, the prod. is heat treated or treated with gaseous hydrogen halide.

(A) is useful for medical or cosmetic uses e.g. care of wounds; for filling pathological cavities in bones, and in skin care formulations. The new treatment, step improves physico-chemical and mechanical properties, esp. absorption capacity and wet strength; while simultaneously reducing the germ count. (A) can absorb 50-100 times its own wt. of water in 1 min. (18pp)

High-foaming tooth-paste esp. with optical cleaning control - contg. gelatin or gelatinous protein deriv. replacing part of surfactant

WURTTENBERG PARFUM 26.03.80-DE-011618
(30.09.81) A61k-07/16
02.09.80 as 105200 (200BZ) (G) No-Citns. E(AT BE CH DE FR GB IT LI LU NL SE)
In a new tooth-paste compsn. having high foaming capacity, a part of the tenside is replaced by gelatin, (IA), or gelatinous protein prods. (IB).

(IA) or (IB) are esp. cold-soluble gelatins or cold-soluble acid gelatin hydrolysates. Tooth-pastes having optical cleansing control contain sufficient dyestuffs so that, on brushing the teeth uninterruptedly, an initial coloured foam formed is brightened by a brightness difference L of 10-30 (15-25) (where L is 0 corresponds to black and L is 100 corresponds to white) not before 20 secs. or more and is discoloured to the only white or only black foam.

On adding 1-10 (2-7)% (IA) or (IB), the tenside content can be reduced to 1-2.5% without lowering foaming capacity. In a tooth-paste having optical cleansing control, discolouration effects achieved are identical. (IA) or (IB) addn. lowers the negative effects of tensides on mouth mucous membrane and of wetting agents on tooth-paste taste. (13pp)

Nickel alloy for dental use - contains chromium, copper manganese, aluminium, silicon and zirconium etc.

SANKIN KOGYO KK 31.01.80-JP-010890

M26 (28.08.81) A61k-06/04 C22c-19/05

31.01.80 as 010890 (53DH)

Dental casting Ni-base alloy, consists of Cr 7-30%, Cu 3-25%, Mn 5-30%, Al 0.1-4%, Si 0.1-4%, additional at least one of Ga, , 0.5-10%, Ge 0.5-10%, Nb 0.5-5% and Zr 0.5-5%, and the balance Ni with incidental impurities.

The Cu prevents the Ni base alloy from oral discolouration or corrosion and retains its Vicker's hardness to less than 250. The Cu lowers the m.pt. of the alloy to below 1200 degrees.C together with Mn, Al, Ga, Ge, Nb and Zr. The Al also serves to prevent surface of the casting from being seized with the embedded material and from producing an oxidised film. Contraction ratio of the alloy being cast is sufficed by the addition of Cr, Si, Nb and Zr. (4pp)

AJIN D21 39646 B/21 = J8 1039-284
Hair tonic - contains acetyl methionine, serine, pyridoxine and pyridoxal-phosphoric acid or pyridoxamine phosphoric acid

AJINOMOTO KK 22.09.77-JP-114261

B05 C03 E19 (11.09.81) *J54046-843 A61k-07/06

22.09.77 as 114261 (5HM)

The hair tonic contains acetylmethionine and serine as the major ingredients and pyridoxine, pyridoxal-phosphoric acid or pyridoxamine-phosphoric acid as the aid. The tonic shows hair-growing activity on human beings and on rabbits, foxes, minks, sheep, etc. It improves the glossiness of hair of above animals, cattle, pets, etc.

Usually the same amt. of acetylmethionine and serine are mixed and the mixture is combined 0.05-5 w/w% in the solvent such as water, 1-4C aliphatic alcohol or their mixt. The aid is combined 1-50 w/w% on the sum of acetylmethionine and serine and may be used in the form of alkali salt. (J54046843) (3pp)

DOW D21 80048 A/44 = NL-167-982
Emulsions of polar liq. in methyl-siloxane fluid - contg. polysiloxane-polyoxyalkylene copolymer and surfactant

DOW CORNING CORP 27.07.77-US-819210

A96 C03 (A26) (16.09.81) *US4122-029 B01f-17 C07f-07/21 C08g-77/46 C08j-03/02 C08l-83/04

26.07.78 as 007912 (922TM)

Emulsions are claimed of a polar fluid (I) in a non-polar fluid (II) comprising (a) 1-70 wt.% (I) as the disperse phase, (b) 17-97.5 wt.% (II), as the continuous phase. (II) has a viscosity of not greater than 100 mPa.s at 25 deg.C and consists of a liquid polymethylsiloxane of repeating unit $(\text{CH}_3)_2\text{SiO}((4-a)/z)$ (where a is 2-3) and/or a liquid paraffinic hydrocarbon, (c) 0.5-3 wt.% of an organic w/o detergent having an HLB of 2-10 and (d) 1-10 wt.% of a polydiorganosiloxane-polyoxyalkylene block copolymer contg. at least one polydiorganosiloxane block whose repeat unit is $\text{RbSiO}(4-b/z)$.

In the formula b is 0-3 and has an average of 1.9-2.1 R gps. per Si atom taking the polymer as a whole, R being (m)ethyl, vinyl, phenyl or a divalent radical with at least 95% of the R being methyl, and at least one polyoxyalkylene block having a m.wt. of at least 1000 and comprising 0-50 mol.% polyoxypropylene and 50-100 mol.% polyoxyethylene, with at least one end of the polyoxyalkylene block bonded to a polydiorganosiloxane block and the end not bonded thereto satd. with an end gp. The wt. ratio of the polydiorganosiloxane:polyoxyalkylene blocks is 2-8:1.

These emulsions, e.g. contg. an insecticide or an anti-perspirant, may be diluted with gasifying alkanes and are thus suitable for aerosols. (7pp)

10.07.79 as 056262 (918PW)

Oxybenzylidene-boranones of formula (I) are new. Z and Z' are each H, SO₃H or a salt with an inorganic or organic base (at least one is H). R₁ is H, 2-18C alkyl (when R₂ is other than alkoxy), 1-18C alkyl (when R₂ is alkoxy) R₂ is H, 1-4C alkoxy or divalent radical - O- bonded to R₁ if the latter is also divalent. If R₁ is H, R₂ is also H. q is 1 or 2 if q is 2 R₁ is divalent radical. When q is 1 at least one of Z, Z', R₁ and R₂ is not H, when Z and Z' are both H. R₁ is not -CH₂- when R₂ is -O-.

8 cpds. are specifically claimed including 3-(3', 4'-dimethoxybenzylidene)-bornan-2-one.

Cpds. can be used in cosmetic compsns. providing protection against actinic rays. (14pp)

DENT-★ D21 75595 D/41 ★US 4291-017
Reducing adherence of plaque to teeth - using dentifrice contg. titanium tetrafluoride and either xylitol or saccharin

DENTAL CONCEPTS INC 19.11.79-US-095699

B06 E32 (B05 E13 E17) (22.09.81) A61k-07/18

19.11.79 as 095699 (914BJ)

The adherence of plaque to teeth is reduced by application to the teeth of a dentifrice contg. 0.001-0.05 wt.% titanium tetrafluoride and either at least 0.05 wt.% xylitol or at least 0.01 wt.% of saccharin. Pref. the dentifrice is in liq. form and the process includes the step of cavitating the compsn. while it is in contact with the teeth. Cavitation may be effected by an ultrasonically vibrating probe inserted into the mouth and into contact with the dentifrice.

The compsn. reduces the cohesiveness of bacterial plaque and the adherence of the plaque to the teeth. It is postulated that the TiF₄ attaches to the receptor sites on the bacteria to reduce the ability of the bacteria to attach to each other or to tooth enamel. The xylitol or saccharin component acts synergistically with the TiF₄.

Apart from being in the form of a cavitation fluid, the compsn. may also be provided as a toothpaste, toothpowder, mouthwash, chewing gum, etc. (4pp)

KANE D21 65092 B/36 = US 4291-018
Lipstick having core and sheath - with different compsns. disposed concentrically

KANEBO KK 23.02.78-JP-020150

A96 E17 (22.09.81) *GB2014-852 A61k-07/02

21.02.79 as 013372 (918TM)

Core-sheath type lipstick comprises compsns. A and B arranged in core-sheath relationship. A consists of a homogeneous mixt. of (i) 55-75 wt.% low-viscosity cpd. of viscosity less than approx. 80 centipoises at 36 deg.C, (ii) 8-28 wt.% cpd. with viscosity approx. 200 centipoises at 36 deg.C and (iii) 17-30 wt.% waxy cpd. solid at 36 deg.C. B consists of a homogeneous mixt. of (iv) 50-75 wt.% (ii), (v) 15-30 wt.% (iii) and (vi) 5-20 wt.% (i).

A and B comprise 77-100 wt.% of the mixts. and have m.pt. 60-75 deg.C, the temp. differences being 0-5 deg.C. The wt. of core compsn. to that of the sheath being wt. ratio 1:2 to 2:1. The low viscosity oily ingredient is pref. mineral oil, squalene, isopropyl palmitate or myristate etc.

Lipstick causes no tacky or disagreeable feel, spreads well with a light touch, adheres evenly and gives protection. Compsn. provides good gloss, clarity, hue and colour development. (10pp)

USDA ★ D21 75604 D/41 ★US 4291-041
Insect repellent contg. (2,2,1)hept-5-en-2-yl carboxamide(s) - used esp. for controlling ticks, chiggers, cockroaches, mosquitoes, stable flies, deer flies, black flies and sand flies

US SEC OF AGRICULTURE 02.02.79-US-008814

Poly:carboxylate based cement contg. water soluble glass - for medical and constructional use

SMITH & NEPHEW LTD 18.11.77-GB-048193 (03.08.77-GB-023789)

A96 L02 P34 + P32 (A93) (07.10.81) *BE-861-507 C03c-03/14

05.12.77 as ----- Div ex 1599753 (982PW)

A glass compsn. comprises 55.7 mole % zinc oxide (ZnO), 38.6 mole % boric oxide (B2O3) and 5.7 mole % magnesia (MgO). The compsn. is used for modifying a polycarboxylate cement compsn.

The glass compsn. is water soluble and is esp. effective in crosslinking agents in the prepn. of polyacrylic acid cements. Increasing the MgO content decreases the water solubility of the compsn.

When mixed with a polyacrylic acid, the mix generates heat to form a thick paste which sets and is unaffected by boiling water over 8 hrs. (2pp)

Gas-deodorising compsn. prodn. - from baked oyaishi stone powder and malted soil

SHINOZAKI M 30.01.80-JP-010412

J01 (28.08.81) B01d-53/34 B01j-20

30.01.80 as 010412 (55AT)

Deodorant is produced by combining baked oyaishi stone powder particle and malted soil. Process consists of first using soil contg. a large amt. of deteriorated substances as a cultivation medium and easily decomposing carbohydrate and proteins e.g. theriac, rice bran etc. as well as compost material e.g. sawdust and bark etc. purely cultivated filamentous fungus and a bacterium are placed on the soil so malted soil is produced by fermentation and decomposition. Powdered Oyaishi stone is baked at high temp. and is mixed with malted soil at a certain ratio and a deodorant produced.

By letting the foul smelling gas pass through produced deodorant, the foul smell is adsorbed and removed. (2pp)

Collagent based drug delivery system (I) resorbable in the body can be sterilised and compacted into the shape of a tablet, spheroid, foil, pipe, plate, fibre, granular, strand or table by the applicn. of heat of a temp. of 130-200 deg.C opt. with the applicn. of pressure of 300-1200 bar. (I) is formed by extrusion with injection moulding or sintering and upon admin. retains its shape and retards liberation of the drug. (I) comprises 0.2-20 wt.% of drug, 1-25 wt.% bisresorbable binding agent for collagen and the balance is finely ground collagen. The binding agent consists of a

co- or homopolymer of lactide or glycolide or a co- or homopolymer of a 2-16C alpha-hydroxyalkanoic acid.

Pref. (I) comprises 0.1-40 wt.% of the resorbable mass of calcium phosphate. The binding agent is pref. a copolymer of lactide and glycolide contg. 10-30 mole % glycolic acid.

The shapable collagen is suitable as surgical material, or an implantable active material depot. (8pp)

LACL- ★ D22 75599 D/41 ★ US 4291-025
Thermally reversible agar gel topical dressing for burns etc. - contains di:ethylene glycol to lower gelation temp. of sol obtd when gel is heated

LACLEDE PROFESSIONA 11.04.80-US-139500

E17 (22.09.81) A01n-31 A61k-31/70

11.04.80 as 139500 (914NS)

Dressing comprises 5-12 (esp. 8-10) wt.% agar, 20-75 (esp. 40-55) wt.% diethylene glycol, and water to 100%, is new. Pref. the gel also includes a strengthening agent chosen from sodium borate, potassium borate, potassium sulphate and/or zinc sulphate. The dressing is for coating on burn area or other area of skin impairment. The gel is thermally reversible, i.e. on heating it forms a sol., and the presence of the diethylene glycol reduces the gelation temp. of the resulting sol. to below 49 deg.C (usually 24-49 deg.C), allowing the sol. to be cooled and applied to the burn or wound when it is at a tissue compatible low temp., following which the sol. resets to a gel on the skin. The diethylene glycol also functions as a plasticiser for the gel, and as a humectant to assist the gel dressing in absorbing fluids from the burn or wound. It is postulated that the diethylene glycol also contributes antibacterial properties. (5pp)

AMST- ★ D22 75638 D/41 ★ US 4291-122
Biological indicator for sterilisation processes - contg. fermentable microorganism and dry carbohydrate sepd. from growth and pH indicator

AMER STERILIZER 14.08.80-US-178096

(D16) (22.09.81) C12q-01/22

14.08.80 as 178096 (478)

Indicator consists of a transparent vial contg.: (a) a fermentable microorganism (I) which is sterilised by essentially the same conditions as the objects to be sterilised, together with a discrete, solid, dry carbohydrate (II) (unavailable for fermentation by (I) in its dry form); and (b) an inner breakable ampoule contg. a liq. (II)-free growth medium and pH colour indicator. In use after the indicator has been exposed to the sterilising conditions, the inner ampoule is broken and the liq. medium is allowed to dissolve (II) and contact any (I) which may be viable. The vial is incubated, and pH changes are watched for. The vial-ampoule system is described in US Applicn. Ser. No. 153136. (I) is pref. Bacillus stearothermophilus (for steam sterilisation), B. subtilis (for ethylene oxide). The indicator is pref. e.g. phenol red.

The indicator is suitable for use in both ethylene oxide gas or steam sterilisations, and reduces the formation of false +ve results. (5pp)

Removal of dark-coloured impurities from cpds. (esp. fatty acids)
is effected by contacting with a borohydride at an acid pH and
distilling the mixt. The borohydride is pref. NaBH₄ and is used in
an amt. of 0.01-0.5 (pref. 0.02-0.05, esp. 0.03) wt. %.

The process is esp. useful for improving the colour of tall oil.
Carrying out the treatment at acid pH eliminates the need for
prior neutralisation of the fatty acids in an aq. medium, thus
simplifying the process and avoiding emulsion formation. (4pp)

Perfume compsn. contg. beta-isopropoxyethyl salicylate - can be
prepd. from inexpensive cellosolve and salicylic acid, has mild
floral fragrance

TAKASAGO PERFUMERY KK 29.01.80-JP-008963

E14 (28.08.81) A61k-07/46

29.01.80 as 008963 (5NS)

Compsn. contains beta-isopropoxyethyl salicylate.

Beta-isopropoxyethyl salicylate (abbr. IPES) shows mild floral
fragrance and better perfume-holding properties than the
salicylic acid esters (e.g. methylsalicylate, ethylsalicylate,
benzylsalicylate, etc.) which have been used in perfumes. IPES
excellently miscible with other materials of perfume use.

IPES can be prepd., e.g. by heat-reacting isopropylcellosolve
and methylsalicylate in the presence of small amount of caustic
alkali in an N₂ gas stream. Amt. of IPES combined 1-30 w/w %
perfume compsn. IPES is not stimulative to skin and never
causes skin allergies. (4pp)

Title cpds. of formula (I) are new (wherein A is CH₃- (CH₂)_n-
CH(CH₃)- or CH₃-(CH₂)_a+2-; B is -CH₂-CH₁/C(F)-CH₂- or -CH₂-
CH₂-CHF-CH₂- (where F is H or -CH₃); n is 0, 1 or 2 or 3; a is 0 or
(I) are prepd. by hydroxylation of the terminal double bond
unsatd. hydrocarbons of formula (II) on hydroboration
hydroalumination. (II) may be prepd. by the alternate
copolymerisation as described in JP4719694. Hydroboration (as
oxidative hydrolysis) is achieved with 0.02-0.6 mole, pref. 0.05-
mole diborane in a polar solvent, e.g. THF, diethylene glycol
dimethyl ether, dioxane at 0-20 deg.C, pref. 0-10 deg.C. The
subsequent oxidative hydrolysis is effected with alkaline H₂O₂ in
a conventional manner. Hydroalumination is achieved with e.g.
Et₃Al, i-Bu₃Al, AlH₃, EtAlH₂, LiAlH₄, etc. in a solvent e.g.
octane, toluene, xylene at 100-200 deg.C, pref. 130-160 deg.C. The
subsequent oxidative hydrolysis is effected on oxidation with
molecular oxygen and subsequent acid hydrolysis. When B is
CH₂CH₂-CHF-CH₂-, (I) may be prepd. by further catalytic
hydrogenation of the corresp. unsatd. (I) with a metal catalyst
such as Ni, Co, Pt, Pd. (I) are useful as antimicrobials
perfumes. For example, 2-methyl-4-nonen-1-ol exhibits MIC (ppm
on a nutrient agar medium): Staphylococcus aureus, 400; Bacillus
subtilis, 400; Aspergillus niger, 800; Saccharomyces cerevisiae,
400; Aspergillus flavus, 800.

17.08.78 as 100160 (22JB)

Fatty acid is purified by adding reducing metal and its hydroxide and then distilling. Thus pale colour fatty acid can be obtained and its colour does not change even after prolonged storage.

The fatty acid may be natural fatty acid derived from animal fat or oil and vegetable oil and fat, or a synthetic fatty acid obtained from the natural fatty acid.

The reducing cpd. may be Sn, Zn, Fe, Al, Mg, Cu, Ca, Ni, Co, etc., and their hydroxides. The metal and metal hydroxide are added to the fatty acid each in an amt. of 0.01 to 5% wt. After the addn. of the metal and its hydroxide, the mixt. is distilled under normal conditions. (J55027156) (6pp)

26.12.77 as 156948 (367DH)

Scouring pads contg. a special alkali metal fatty acid soap are claimed. The fatty acid has an average carbon number of 16-20 and an iodine number of 30-45 (esp. 35-43) and is 85-98 (esp. 90-96)wt.% neutralised with alkali.

The fatty acid is pref. partially hydrogenated tallow fallow acid, e.g. produced by hydrogenating tallow fatty acid (with an iodine number of 48) at 150 deg. C and 4.0 kg/sq.cm in the presence of 0.05% of a Ni catalyst for 1 hr. The alkali metal can be Na or a mixt. of Na and K with a Na:K wt. ratio of 100:0 to 90:10. The soap can opt. be used in combination with synthetic detergents, inorganic salts, dyes, perfumes, microbicides and/or rust inhibitors. The soap inhibits scratching of the article being scoured and suppresses rusting of the (steel wool) pad during mfr. and use. (J54087707) (5po)

The system continuously spray-dries a washing paste in a cylindrical drying tower, the paste being 10 to 50% by wt. water and 50 to 90% by weight solids, containing a synthetic active washing material and an organic or inorganic strengthener. This is delivered to spray heads at different levels in the tower and dried by hot air flowing in the opposite direction.

The hot air is caused to perform a cyclonic upwards movement, forming in the tower an annular drying zone enclosing a cylindrical low-pressure one. 30 to 80% of the paste is continuously sprayed directly into the drying zone in the opposite direction, in the area below 88 -deg. isotherm and above the paste boiling point isotherm, via nozzles evenly spaced in a horizontal plane in the drying zone, so that each jet dissolves into particles inside the latter.

The remainder of the paste is continuously sprayed directly into the drying zone in the area above the 88 -deg.C isotherm, via nozzles evenly spaced in a horizontal plane, so that each jet also dissolves inside the drying zone into particles. (10pp)

Aluminosilicate cpds. contg. combined surfactants - prepd. by replacing part of aluminate by an aluminium salt

HENKEL KG AUF AKTIEN (DEGS) 18.06.77-DE-727475

E33 (07.10.81) *BE-868-185 C01b-33/28 C11d-03/08

31.05.78 as 025684 (945PW)

Prepn. of a water-insol. radiographically amorphous alkali metal aluminosilicate is claimed. It contains bound water and bound surfactants, and based on the surfactant-free, anhydrous form has molar compsn. $aM_2O, Al_2O_3, bSiO_2$, where $a = 0.7-1.5$; $b = 0.8-8$, and M is Na or K. The hardness-resistant surfactant is present at 0.01-50wt.% based on the anhydrous, surfactant-contg. aluminosilicate.

Process comprises mixing aq. alkali metal silicate soln. and aq. alkali metal aluminate soln. Part of the aluminate soln. is replaced by acid Al salt soln., added separately, so that excess alkali metal is converted to a neutral salt by the acid gp. of the Al salt for removal with the mother liquor. (10pp)

PROC D25 13512 D/08 = GB 1599-560
Laundering of fabrics - in aq. soln. contg. ethoxylated alcohol as detergency booster, and nonionic and/or anionic surfactant

PROCTER & GAMBLE CO 15.05.78-US-905714

E17 (07.10.81) *US4248-729 C11d-01/68

31.05.78 as 026093 (974MR)

Novel aq. laundering liquors comprise 0.075-0.20wt.% detergency

booster (I), 0.02-0.12wt.% nonionic and/or anionic deterative surfactant(s), 0-1.5wt.% deterative adjunct material(s) (II) and water to 100%.

(I) is an ethoxylated prim. aliphatic alcohol with an average aliphatic chain length of 12-13C and an average degree of ethoxylation about 3. (II) is a detergency builder, bleach, water softener, soil suspending agent and/or thermally stable enzyme.

Pref. (I) is 0.1-0.13wt.% of the compsn., esp. 0.125wt.%. (7pp)

Impregnation of foam sheet with melted substance - acting as fabric softener for clothes in tumble dryer

CALIGEN FOAM LTD 04.03.81-GB-006769 (04.03.80-GB-007228)

A35 E17 P42 (A97) (07.10.81) B05c-01/08 B05d-07

04.03.81 as 006769 (295MR)

A substance is dispersed in a thin, flexible substrate of open-celled foam. The substance is melted and the substrate compressed. The substrate is allowed to expand to its normal size and simultaneously draw the melted substance into the open cells to impregnate the substrate. The substrate is cooled to solidify the impregnated substance.

The compression of the substrate may be effected by passing through a pair of nip rollers associated with an applicator roll for applying the melted substance.

The substance impregnated may be stearic acid ethoxylate. Sections of the treated foam may then be added to dryers along with clothing with which they are tumbled during the drying cycle. The temp. causes melting of the substance which is gradually released and acts as a fabric softener. (5pp)

Softening agent for washing - contg. ethylene oxide or ethylene oxide-propylene oxide adduct of higher aliphatic alcohol

NEW JAPAN CHEM 28.01.80-JP-009218

A97 (25.08.81) D06m-15/10

28.01.80 as 009218 (172WB)

Softening agent contains, as effective ingredient, ethylene oxide or ethylene oxide-propylene oxide adduct of aliphatic higher alcohol with iodine value 20-80. Ethylene oxide is added in amt. such that HLB value is at least 11. When both ethylene oxide and propylene oxide are added, propylene oxide is used in less than half the amt. of ethylene oxide. The alcohols are unsatd. higher alcohols obtd. from natural, animal and vegetable oils and fats and any other sources. At least 2 alcohols may be blended to the above iodine value. The softening agent can be blended with ordinary detergents in amt. at least 2%.

The softening agent is capable of dispersing soap scum and prevents yellowing of washing. The effect is increased after repeated washing. Washing and softening treatment can be accomplished in one operation when it is blended with detergent. (3pp)

Arrangement of Abstracts

'MAJOR' COUNTRIES – An alerting abstract of every basic document is provided, and of examined equivalents from West Germany, Great Britain, Japan, the Netherlands and the United States, and granted and unexamined European and unexamined PCT equivalents. The abstracts are arranged in CPI class order and within any one of the 135 classes are in country and patent number order.

'MINOR' COUNTRIES – Basic headings are included in sequence with the entries from the 'Major' countries.

D11: BAKING

KEMP/ ★ D11 75752 D/42 ★ BE -889-034
Flat belt V-trough kneading machine for dough pieces - is adjustable for wheat and rye based doughs in various sizes
KEMPER K 13.03.81-DE-109683 (06.06.80-DE-021329)
(01.10.81) A21c
01.06.81 as 889034 (448RH)

A bakery machine is for kneading dough pieces in a circular motion between two endless flat conveyor belts. The belts are arranged edge to edge with their active surfaces at an angle to form a 'V'-shaped trough in which the dough pieces are kneaded as they are advanced along the trough.

The frame of one conveyor belt is now linked to a rotary eccentric which displaces the frame in a circular motion perpendicular to the surface of the belt. The edge of the belt at the inner part of the 'V' is protected by a shaped kneading bar which moves with the conveyor belt frame.

The centre line of the 'V' is pref. inclined to the horizontal by less than 90 deg. and more than 20 deg. with the centre line of the 'V' set at between 40 and 50 deg. Pref. about 45 deg. to the horizontal, the faces of the two belts are symmetrically inclined on each side of the centre at an angle between 30 and 40, pref. 35 deg. Pref. both conveyor belt drives are reversible, as is the eccentric drive. A common switch may be wired to reverse all three drives simultaneously. Adaptable to knead satisfactorily both wheat based and rye based doughs as well as those based on wheat mixts. and rye mixts. Also readily adjustable for a range of sizes of dough pieces. (18pp)

VBER- ★ D11 75774 D/42 ★ BE -889-120
Bread slicing machine with motor driven load feed - powered via current limiter to reduce speed above given slicing resistance
MIJ VAN BERKELS PAT 06.06.80-DE-021284
P62 (01.10.81) B26d
05.06.81 as 889120 (1190DH)

The bread slicing machine comprises a motor which drives the cutter blade assembly and a motor driving a chain, which moves the loaf transport slide such that its feed rate automatically adapts to the consistency of the loaf at the area where it is cut.

The power connection to the motor contains a current limiter which steeply reduces its speed when the brake force presented to the slide increases the power absorbed above a given level.

The power connection may contain an interruptor switch which responds to the period during which the limiter is operative and/or to an excessive drop in the motor speed. (7pp)

KEMP/ ★ D11 75862 D/42 ★ DE 3011-863
Dough portioning device - prevents air inclusion by keeping pistons flush in empty chambers
KEMPER K 27.03.80-DE-011863 (00.00.79-DE-915348)
(08.10.81) A21c-05/04
27.03.80 as 011863 Add to 2915348 (39KB)

A dough portioning device for crusty rolls or small loaves of bread with a group of measuring chambers on the periphery of a revolving drum, each with a piston in various positions depending on the angle of turn, was described in the parent patent. In the dough discharge position, the measuring pistons are flush in their measuring chamber with the periphery and remain in that position for 180 deg. until they face the loading position.

This ensures that no air is trapped during the loading operation and the dough is treated gently. (19pp)

WINK ★ D11 75881 D/42 ★ DE 3012-289
Baguette transfer machine - with basket of bridge, straddling conveyor, and lifting and tipping baguette on oven conveyor
FR WINKLER SPEZZ KG 29.03.80-DE-012289
(08.10.81) A21b-03/07 A21b-07
29.03.80 as 012289 (39RP)

A machine to transfer baguettes from the outlet of a dough raising cabinet to the conveyor of a baking oven includes a conveyor which is straddled by a bridge with an articulated transfer basket. This can lift up the wooden moulds with the baguettes, move across the gap to the oven conveyor, tip the dough and deposit the moulds back in the pickup position. A mechanically raised roller table then carries the empty mould away sideways.

This machine is suitable for a transfer of baguettes, either in wooden moulds or in sheet metal moulds, fully automatically.

RIEG/ ★ D11 75948 D/42 ★ DE 3013-003
Easily cut, non-crumblly six-grain bread - contg. oat, maize, sesame, barley, wheat and rye grist and flour, linseed and millet
RIEGLER H 03.04.80-DE-013003
(08.10.81) A21d-13/02
03.04.80 as 013003 (200RP)

Six-grain bread consists, w.r.t. total dough, of 5-10% oats, 3-10% maize, 3-10% sesame, 3-10% barley, 3-10% wheat grist, 5-10% rye grist, 1-6% linseed, 1-8% millet, 0.5-2% spice, 25-35% water, 5-15% rye flour, 5-27% 5-27% wheat flour, 0.5-3% baking assistants, 0.5-1% salt and 1-3% yeast.

The bread obt'd. is nutritious, porous and can be baked thoroughly, can be stored and frozen, and cut both fresh and after prolonged storage. The bread can be coated with spread, does not crumble and has a pleasant taste compatible with butter, cheese, sausage, fish and sweet foods. (5pp)

WINK ★ D11 75984 D/42 ★ DE 3013-330
Baking vapours waste heat recovery - by heat exchanger in first and by recycling to steam zone in second zone
FR WINKLER SPEZI KG 05.04.80-DE-013330
(08.10.81) A21b-01/24 A21b-03/04
05.04.80 as 013330 (39AS)

The waste heat energy of continuous conveyor baking ovens is recovered by passing the hot vapours from the baking channel in a first stage through a heat exchanger for the prepn. of hot water and for an increase of their relative humidity. In a second stage, the lumps of dough are moistened by the vapours in a steam zone, assisted by an additional water spray if necessary to correct the relative humidity.

The waste heat recovery results in a great redn. in the consumption of live steam and in the prodn. of hot water. (9pp)

HABE/ ★ D11 75986 D/42 ★ DE 3013-348
Bread and pastry mfr. - from grain flour mixed with green flour contg. ground pasture grass, clover and/or lucern
HABERL P 05.04.80-DE-013348
(08.10.81) A21d-02/36
05.04.80 as 013348 (200RH)

Green flour of ground pasture- and meadow grasses, clover- and/or lucerne types (medicago) is added to an initial mixt. for prepg. baker's wares, esp. bread, biscuits, cookies, long-life bread, etc. The initial mixt., contg. a grain fraction, -grist or -flour, esp. rye- and/or wheat flour, water, yeast, NaCl and opt. further additives, is baked after raising the kneaded dough.

The green flour plants, esp. lucerne, have a high content of proteins, hemi-celluloses, pentosans and minerals. A high water absorption and dough yield can be achieved and the dough ripens quickly. The increased content of Ca, Mg, Na, K, Fe and Co and of lysine and cystine increases the nutritional value of the bread and also improves bread taste and aroma. (8pp)

PUMA- ★ D11 76223 D/42 ★ FR 2477-378
Bakery gravimetric process and installation for dividing dough pieces - of accurately controlled wt. at high prodn. rate
PUMA 06.03.80-FR-005077
(11.09.81) A21c-05 A21c-11 A21d-08/02
06.03.80 as 005077 (448BZ)

A bakery, gravimetric process and installation for dividing bread dough into pieces of known wt., each for making a loaf. The process is of the type in which dough from a hopper is reduced in thickness rollers which deliver a continuous sheet of dough. The leading end of the sheet advances onto and across the weigh head of a weighing machine, pref. a weighing conveyor. Each time the weigh head registers a predetermined wt., that piece of sheet is cut transversely from the front end of the sheet. The width between hopper side walls is equal to the width of the sheet and is a multiple of widths of individual dough piece strips into which the sheet is longitudinally slit.

The progressive thickness reduction of the dough via a hopper and rolls to final sheet is effected by stress forces applied only in a direction normal to the thickness. The advance of dough between hopper and delivery of dough piece strips is continuous, transverse cutting taking place as the sheet is in motion.

Used for bakery maps prodn. of dough pieces of known wt. for bread mfr. (16pp)

SWIL D11 91700 A/51 = GB 1600-167
Biscuit counting stacker - with biscuits transferred from inclined pockets of endless conveyor by rod pairs on second conveyor (NL 5.12.78)

SIG SCHWEIZERISCHE 02.06.77-CH-006812
Q31 Q36 + Q35 (14.10.81) *DE2823-690 + B65h-29

26.05.78 as 023345 (006AS)

Stacking appts. for flat articles such as biscuits, comprises a conveyor with relatively-movable pockets to which are distributed sequentially, specifically from a supply chute with a vertically reciprocating platform with slots for pusher fingers.

Stacking bars disposed in pairs above the pockets move in the same direction as the conveyor but at different speed, and displace articles from one pocket to another to form stacks. Specifically the stacking bars travel either faster or slower than the conveyor. Pref. the pockets slope at 10 to 30 deg. to horizontal. (6pp)

CAVA/ ★ D11 76334 D/42 ★ GB 2073-089
Die plate for extruding tubular pasta - two discs with cooperating projections and holes securable to conventional extruder

CAVALLI A 04.04.80-IT-021392
(14.10.81) A21c-11/16

26.02.81 as 006144 (1358RH)

A plate is connectable to a conventional extruder by a threaded ring nut and comprises a disc with solid circular section parts projecting from one surface and a second disc with openings to receive the parts. The first disc has through holes coaxial with and of greater diameter than the parts.

The parts are fixed within respective holes in the first disc by support webs in the base of the holes. The openings in the second disc are pref. frustoconical and each disc has peripheral shoulders for engagement by the nut. The webs pref. project from the first disc to engage the second disc opening. (5pp)

ISKH/ ★ D11 77200 D/42 ★ SU-797-969
Bread loaves feeder - includes accumulating conveyor with escapement at junction with transfer conveyor

ISKHAKOV E G 31.07.78-SU-651339
X25 Q31 (23.01.81) B65b-05/10 B65b-35/20

31.07.78 as 651339 (89WD)

Bread feeder and placer of enhanced reliability has an accumulating conveyor perpendicular to the input conveyor, while single item transfer mechanism is fitted at their junction. The escapement includes a support guide set across the accumulating conveyor with the bread transferred by an endless conveyor with a pusher.

The bread loaves reach the transfer point of the accumulating conveyor I in a random manner with the curved profile of the guide 6 preventing turnover. Sensor 9 provides a signal in the case of loaf presence for pushing the bread onto conveyor 2 by shifter 8. The loaves are transported to the abutment 3 where pairs are assembled for pushing between flaps 10. Bul.3/23.1.81 (3pp Dwg.No.1)

MOFO= ★ D11 77438 D/42 ★ SU-798-54
Bread dough baking preparedness monitor - fixes readiness by analysing rate of change of resistance of extrema, counts indicating dough fermentation

MOSC FOOD IND TECHN 27.03.79-SU-755815
S03 X25 (23.01.81) G01n-33/10

27.03.79 as 755815 (39MC)

A device, to determine that half-finished products of the bread baking industry are ready for baking, consists of a pickup which is placed in the lump of dough and is joined to the input of an a. bridge. On receipt of a signal from a control unit, the bridge measures a first value of the dough resistance which is passed to a recorder, and through a key to a buffer register. A later second value enters the buffer register via another key. Bul. 3/23.1.81 (3pp)

D12: MEAT; FISH PROCESSING

LAVI/ ★ D12 75776 D/42 ★ BE-889-126
Powdered caramel mfr. from sugar by heating - adding ammonium salt, then foaming the mass, cooling and grinding

LAVIE L F 26.02.81-US-238648 (04.07.80-CH-005174)
E35 (01.10.81) A23g C13d

05.06.81 as 889126 (597RF)

The process comprises heating sugar to 140-200 deg.C and letting the viscous caramel obtd. cool to about 120 deg.C. An ammonium salt, which is volatile or in gaseous form at this temp, is then added to precolour the mass. The mass is then transformed into foam by adding sodium bicarbonate and an edible acid. The foam is then cooled to ambient temp. and ground.

Caramel is used e.g. in confectionery and in drinks. The powder form is easy to transport and handle and does not take up moisture when packed in a sealed container. It is also useful in drink dispensers and can be used as a carrier for normally liquid ingredients such as phosphoric acid. (8pp)

KOCO/ ★ D12 D/42 ★ CS 8101-237
Singed pigs hides scraper
KOCOUREK M 20.02.81-CS-001237
(10.09.81) A22b-05/08

FARH ★ D12 75577 D/42 ★ DE 8012-252
Cellulose hydrate tube with impermeable lining esp. for sausage skin - produced by squeezing in roll gap above reservoir surface of dispersion coating

HOECHST AG 28.03.80-DE-012252

A11 P42 (A22 A97) (06.10.81) A22c-13 B05c-07/04 B05d-01/40 B05d-07/22

29.03.80 as 012252 (754DH)

the tube passes between two rolls or belts in a roll gap (21) which forms the metering gap; thus the film (23) applied to the internal surface of the tube from the liquid is metered to the desired quantity at this point and after this the tube continues upward through a drying stage, typically a hot-air unit (25).

Here the moisture content of the internal coating liquid evaporates and diffuses outwards through the tube wall, thus forming an internal film on the tube. The tube is subsequently cooled (28), optionally sprayed with water (29) on its external face, pressed flat (30) and wound onto a storage roll (31).

The method does not require the use of an excessively diluted dispersion which results in a non-uniform film and distortion of the tube properties due to the action of too much water. (40 Dwg.No.1)

 04.80 as 012622 (39KB)
 Laminated case for sausage or meat consists of at least two
 connected concentric hoses which are tied together at both
 ends by common closures. One of them is a load-carrying hose
 and the other can be designed as a barrier against moisture
 and/or air. A mechanical protection hose can be added and one of
 the hoses can carry an imprint or can be perforated.
 This saves the conventional lacquering and the high labour
 costs for this operation. An extra packing for display in
 supermarkets is saved and all information required by a
 customer can be incorporated. (20pp)

 US4104763 FR2078017 US3646637 US3156006 E(AT BE CH DE FR
 GB IT LI LU NL SE)
 A string of linked sausages formed in natural intestine casings is
 fed onto a drum. At the upstream end of the drum, the sausages
 pass between convergent pairs of rollers which are radial to the
 drum. At a downstream section of the drum, the sausages are
 pressed against the surface of the drum by resilient pneumatic
 rollers whose axes are parallel to that of the drum. These rollers
 correct the pose of the sausages. A cutter severs the links of the
 sausages at a station adjacent the downstream end of the
 pneumatic roller section.
 Sausages in natural casings can become distorted. The drum
 accepts distorted sausages and partially restores their shape so
 that they can be cut through the links without damaging the body
 of the sausages. (16pp)

NEST ★ D12 76042 D/42 ★ EP --36-973
 Spun fish protein prodn. from alkaline protein soln. - by injecting
 into acid coagulant, then washing, heat fixing and neutralising
SOC PROD NESTLE SA 31.03.80-CH-002521
 (07.10.81) A23j-03 D01f-04
 09.03.81 as 101718 (1251AT) (F) No-citns. E(DE FR GB IT SE)
 Process for spinning fish proteins comprises first forming an
 alkaline protein soln. by (a) grinding fish (whole or pieces) with
 water at wt. ratio water:fish 0.7-2.5 (1-1.5); (b) adding alkali at
 alkali:fish wt. ratio 0.5-1.5 (dry wt. basis); (c) heating, pref. by
 steam injection, at 60-100 deg.C for 0.5-3 min; (d) cooling to 35-60
 deg.C; (e) passing through a colloid mill; (f) centrifuging to
 remove solids, then (g) deaerating, opt. with concn. to dry matter
 content 6-10 wt.%.
 The soln. is then passed through a spinnerette into a soln.
 maintained at pH 0.7-0.9 and salt concn. 7-15 wt.%, then the fibres
 formed washed, heated (to fix their structures) and neutralised,
 pref. to pH 6-6.8. The protein fibres themselves are claimed.
 The fibres are highly nutritious (protein efficiency ratio about
 3.8; better than casein) and useful for making e.g. rollmops or fish
 sticks. They can be made from whole fish or fish processing
 wastes without requiring any additives, have excellent
 mechanical qualities, are white or grey (depending on whether
 the starting material included skins and heads) and have nearly
 the same taste as the original fish. (14pp)

 E(AT BE CH DE FR GB IT LI LU NL SE)
 Packaging case, esp. a synthetic sausage skin, is made of a
 hydrated cellulose hose which has on the inside an adhesion
 activator layer and receives an internal coating of an aqueous
 dispersion, containing at least 20 wt.% dispersed synthetic resin.
 The hose is passed in an ascending direction between flattening
 rolls above the level of the dispersion which leaves a metered
 film. A heating zone removes the dispersing agent through the
 skin. After external moistening and flattening the finished hose is
 wound up to a coil.

This produces a uniform uninterrupted film of a synthetic
 polymer on the inside of a hydrated cellulose hose. The energy
 consumption is low and there is no undesirable dimensional
 change of the hose by shrinkage. (35pp)

FARH ★ D12 76062 D/42 ★ EP --37-024
 Hydrated cellulose hose with internal coating - mfd. by squeeze
 rollers for aq. synthetic resin dispersion

 DE2856253 EP---1545 E(AT BE CH DE FR GB IT LI LU NL SE)
 Hose, for use as a sausage skin, is made by moving a hydrated
 cellulose tube, filled partly with an aq. liq. with a chemical
 substance suitable as a coating, in the ascending direction
 between two revolving rolls. At least one of the rolls is profiled.
 The gap between the rolls fixes the thickness of internal coating
 and the air-filled hose is passed through a hot air drying tunnel, a
 cold air spray, a water spray, and a pair of squeeze rolls before it
 is wound up on a reel.

This permits two to four times faster processing speeds. The
 aq. dispersion cannot run off. The energy consumption is low and
 the coating liq. can be metered accurately. (50pp)

 20.03.81 as 102081 (38HM) (G) DE1938748 EP---8646 US2961323
 DS1142297 DE1900324 DS1504690 DE2540996 E(AT BE CH DE FR
 GB IT LI LU NL SE)
 Hose, made of hydrated cellulose, for use as a sausage skin, is
 coated on the outside with an aqueous dispersion, containing at
 least 20 wt.% of dispersed copolymer. The hose is passed through
 a tank with the dispersion and vertically up through the gap
 between two rolls which equalize the adhering coating. A drying
 tunnel is followed by a water spray before the finished hose is
 wound up.

The hydrated cellulose hose is dipped through a tank contg. e.g.
 an aq. dispersion of 20-40 (20-30) wt.% of dispersed copolymer,
 contg. at least 75 wt.% of copolymerised vinylidene chloride. The
 rolls with the gap leave a thin film which is equalised to the film
 by rolls. A drying tunnel is followed by a hot steam humidifier
 before the hose is coiled up. The film is adjusted to come within 6
 to 20 g per sq.m. Typical figures are: hose speed 40 m/min;
 applied polymer film thickness 20 µm, reduced by drying to 8-10
 microns.

This produces a uniform uninterrupted film on the outside of a
 hydrated cellulose hose and prevents shrinkage of the hose.
 (24pp)

 e speed of the cam drive applies a correction by controlling the
 reversible motor.
 This ensures that the dosage device always has the correct
 position relative to the casting plates. PS (8pp)

ENK D13 73985 D/41 = EP --37-017
 at compsn. suitable as milk fat substitute - contains fatty acid-
 butyric acid triglyceride and opt. hardened fat or oil
HENKEL KG AUF AKTIEN 27.03.80-DE-011807
(07.10.81) *DE3011-807 + A23d-05 C11c-03/08
 03.81 as 102055 (1251JB) (G) No-Citns. E(AT BE CH DE FR GB
 IT LI LU NL SE)
 fat with properties resembling milk fat comprises (a) 10-50 (12-
 3)wt.% fatty acid-butyric acid triglyceride (I) made by
 sterifying mainly 16-20C fatty mono- and/or di-glycerides with
 butyric acid (anhydride) and (b) 50-90 (82-88)wt.% of one or more
 2-20C fatty acid-contg., opt. hardened, fats or oils.
 Esp. the fat contains 3-5% butyric acid (on total fatty acids) and
 an also include 6-10C fatty acids to provide a fatty acid compsn.
 imilar to that of natural butter fat.
 The compsn. is used as a replacement for milk fat. It can be
 nexpensively prepd. from animal or vegetable fats available in
 arge quantity and has improved storage stability. (9pp)

PROC ★ D13 76108 D/42 ★EP --37-144
 Stable chromium complexes - useful for providing dietary
 chromium supplements and as hypoglycaemic agents
PROCTER & GAMBLE CO 31.03.80-US-136018
B05 C01 E12 (07.10.81) A23k-01/16 A23l-01/30 A61k-31/28

 23.03.81 as 200316 (1248AS) (E) No-citns. E(AT BE CH DE FR GB
 IT LI LU NL SE)
 Chromium complex of formula (I), for providing to a human or
 lower animal a nutritionally supplemental amt. of chromium, is
 new.

X and X' are each O, NH, S or NR₁; Y and Y' are each alkyl,
 aryl, H, COOR₂, SR₁, OR₁, perfluoroalkyl or perfluoroaryl; Z is
 NO₂, H, COOR₂, NHCOR₂, CN, OR₁, COR₁, SCN, CHO,
 perfluoroalkyl, alkyl, aryl or perfluoroaryl; R₁ is 1-22C alkyl or
 aryl; and R₂ is 1-22C alkyl. Provided that when X and X' are both
 O and Y and Y' are both Me, then Z is other than H.

Complexes (I) are dietary supplements and hypoglycaemic
 agents for man and animals; by preventing chromium
 deficiency, diseases such as juvenile-onset and maturity onset
 diabetes involving impaired glucose metabolism are avoided.
 Complexes (I) are stable and safe for use. Dose is 0.15-100
 micrograms of Cr (as complex)/kg, higher dosages being used in
 diabetes therapy (usually 1-4 times daily). (23pp)

PURD D13 77551 D/42 = EP --37-180
 Prodn. of mature asexual cacao embryos - by non-agricultural in-
 vitro culture of immature zygotic embryos
PURDUE RESEARCH FOUNDATI 20.03.80-US-131883
P13 (07.10.81) *US4291-498 + A01g-07

 LI NL SE)
 A non-agricultural method for production of cacaoembryos
 comprises (A) treatment of immature zygotic cacao embryos in
 a basal medium in presence of a growth enhancer to initiate
 asexual embryos. (B) proliferating the embryos by low sugar
 amendment of basal media after removal of the growth
 enhancer, (C) growing the embryos in the media under aerated
 conditions to optimum size under the low sugar conditions, (D)
 continuing the growth of the embryos in the media under aerated
 conditions and by a high sugar amendment to the basal media,
 and (E) harvesting the embryos so produced. (13pp)

GENO ★ D13 76139 D/42 ★EP --37-205
 Frozen aerated gelatin dessert compsn. - free of starch, and
 prepd. so as to contain small ice crystals
GENERAL FOODS CORP 27.03.80-US-134609
(07.10.81) A23g-09/20
 17.03.81 as 301120 (955HM) (E) No-Citns. E(AT BE CH DE FR GB
 IT LI LU NL SE)
 Frozen aerated gelatin dessert free of starch is prepd. by
 dissolving in water 0.6 to below 5.0wt.% gelatin and 5-50wt.%
 soluble solids based on wt. of compsn., and sufficient acid to give
 a pH of 2.5-7, cooling the mixt. to 10-32 deg.F to at least partially
 freeze the mixt. while simultaneously agitating and aerating the
 mixt. to an overrun of 3-200%, then shaping the mixt. and cooling
 it to below 10 deg.F to give a prod. contg. ice crystals of size 20-200
 microns.

The prod. is smooth and creamy without a gummy or icy
 quality. It retains its shape and does not release water during
 thawing, and will remain on a stick. It is storage stable. (14pp)

GENO ★ D13 76140 D/42 ★EP --37-208
 Modified waxy maize starch having properties of tapioca - prepd.
 by heat treatment followed by pre-gelatinisation
GENERAL FOODS CORP 31.03.80-US-135578
(07.10.81) A23l-01/19
 18.03.81 as 301147 (955DH) (E) BE-850900 US3527606 US2401813
 GB1499023 EP--20096 E(AT BE CH DE FR GB IT LI LU NL SE)
 Pregelatinised waxy maize starch of improved flavour is prepd.
 by heating waxy maize starch granules to 120-180 deg.C for a time
 between 0.1 and 24 hrs., sufficient to suppress the development of
 woody off-flavours but not enough to cause dextrinisation, and
 then pregelatinising the starch granules.

Waxy maize starch having the usual water content of 8-12% is
 used. Treatment temps. are 170-190, esp. 180 deg.C, and
 treatment time is pref. 15-20 mins. The starch is then
 pregelatinised by normal methods e.g. by drum drying a slurry.
 Heat treatment after pregelatinisation is ineffective. The treated
 starch may opt. be chemically modified e.g. with propylene oxide
 and phosphorus oxychloride.

The starch is useful in sauces, soup mixes and instant
 puddings, etc. as a substitute for chemically modified tapioca
 starch. It does not require chemical modification, and as waxy
 maize starch is readily available, does not suffer from the high
 price and uncertainty of supply associated with tapioca. (18pp)

GENO ★ D13 76141 D/42 ★EP --37-209
 Low calorie foods contg. indigestible poly:ol(s) or polysaccharide
 (s) - with cellulose fibre contg. compsn. to reduce diarrhoeal
 tendencies

GENERAL FOODS CORP 31.03.80-US-135597
(07.10.81) A23l-01/30
 18.03.81 as 301148 (955JB) (E) DE2644621 DE2458650 US4042714
 US3876794 DE2729370 GB2028341 E(AT BE CH DE FR GB IT LI
 LU NL SE)
 Low calorie foodstuffs contg. more than 10 wt.% dry basis of
 edible polysaccharide and/or polyols also contain 1/4-2 times the
 wt. of polyol or polysaccharide of a cellulose fibre contg.
 compsn., which is esp. derived from dehulled soybeans and/or
 citrus albedo, to reduce diarrhoea induced by the polyols or
 polysaccharides.

Inclusion of the cellulose fibre compsn. allows foods to be
 formulated with higher levels of polyols or polysaccharides than
 previously possible. (14pp)

RHON ★ D13 76177 D/42 ★EP --37-300
Compsn. for preparing instant desserts - contains purified whey protein and hydrophilic Xanthomonas colloid

RHONE-POULENC INDUSTRIES 21.03.80-FR-006305

(07.10.81) A23j-03 A23l-01/34

13.03.81 as 400383 (1251BZ) (F) US4089987 FR2365297 FR2399214 FR2452881 EP---7054 FR2119365 E(AT BE CH DE FR GB IT LI LU NL SE)

New expanding food compsn. contains at least whey proteins (A) extd. using 'Spherosil' (RTM) ion exchangers and a hydrophilic Xanthomonas colloid (B), esp. xanthan gum. Pref. the wt. ratio (A):(B) is 5-15%. Prodn. of expanded instant desserts comprises mixing milk or water with a powder contg. this compsn., another colloid (pref. Na alginate and/or a carraghenate); a non-chemically-modified starch (pref. pregelatinised); a food-grade phosphate (pref. tetrasodium or tetrapotassium pyrophosphate), and opt. a sweetener, acidulant or flavouring.

The compsns. contain no fat or emulsifier, are compatible with milk or water at acid pH; produce foams of good organoleptic and nutritive properties which are resistant to syneresis and which can be frozen. (26pp)
